Patrons: Her Most Gracious Majesty the Queen & H.R.H. the Prince of Wales.

TO OUR CUSTOMERS.

E have much pleasure in presenting our Catalogue of Dutch and other Flower Roots, Roses, Fruit Trees, &c., for the present Autumn, and again beg to thank our numerous patrons for their very kind and extended patronage of last season, at the same time assuring them that their future commands will receive the same careful attention as their esteemed favours of the past.

We are personally acquainted with the best growers in Holland, whose grounds we visit from time to time, and our Retail Bulb Trade is one of the most extensive in the United Kingdom. We have, therefore, much pleasure in drawing the attention of the public to the splendid selection we offer in Hyacinths, Narcissus, Tulips, &c., and which includes the very best in their respective classes, whilst several important additions have been made, our prices being fixed at the lowest rate compatible with sound well-ripened bulbs.

CHOICE NAMED HYACINTHS are a special feature in our bulb trade, and we would point out to our patrons, that the bulbs we offer of these are true to name, fully matured, a of an age and size to ensure, under fair cultural conditions, a fine display of bloom. This is important matter, but one that is frequently overlooked in purchasing "cheap" bulbs at Aucti Rooms, or from unscrupulous dealers.

October is the best month for general planting, and to secure special varieties orders shou reach us as soon as convenient before the middle of that month.

NURSERY DEPARTMENT.

Our Nurseries are finely situated on the Newmarket and Ipswich Page, and the soil is of ty very best description for producing well-rooted handsomely-rooted and Roses, and are our speciality. The growth of our business in this depake been phenomenal, and to meet the aduirements of our large important branch we have added considerably to the extent of houses during the past few years. We have much pleasur grounds are now replete with a superb assortment of choice Ro Evergreen Shrubs, Coniferous Plants, &c.; whilst our glass-houses occhoicest in Florists' Flowers, Stove and Greenhouse Plants, Ferns, We would draw the especial attention of intending planters to our fruits in standard, trained, dwarf, and pyramidal trees, which or season are unusually fine.

September 1st, 1891.

Bulbs and Plants for Early Forcing.

The following are specially recommended to the notice of those desiring a supply of flowers at Christmas and early in the New Year.

HYACINTHS, EARLY WHITE ROMAN,

Early White Roman Hyacinths.

Deliciously fragrant and very early flowering variety. By planting early in September and gently foreing, the Early White Roman may be had in bloom in November, and a few sneessive plantings at intervals of about a fortnight will ensure a continuance of bloom till after Christmas. Both in bulb and flower they are smaller than the ordinary Hyacinth, and should consequently be planted five or six in a pot. The delicately scented flowers, which are produced in great profusion, are exceedingly valuable to ent for bouquets, &c.

BOUVARDIAS. All the best sorts, strong plants per doz. 18s., 21s., and 24s.
AZALEA INDICA. Double and semi-double pure white and other varieties. A. Borsig, Deutch Perle, Narcissiflora, &c.,
splendid for forcing, good plants, well set with buds cach 2s. 6d. and 3s. 6d.; per doz. 24s. to 36s.

Lily of the Valley.

For early forcing single crowns of these should be planted about twelvo in a five-inch pot, with the buds well above the surface. Cover the crowns with a little moss or an inverted flower pot and place them in a good heat of say 85 or 90 degrees; water frequently with topid water, and if judiciously looked after they will bloom in four or five weeks from time of potting. Good single crowns are much the best for this purpose.

Selected single crowns for forcing

per doz. 1s.; per 100, 6s.

Spiræa Japonica.

Perhaps the most elegant and useful of all plants for early forcing. Lovely and chaste spikes of elegant white inflorescence, and is singularly adapted for pot display, table or hand bouquets, &c., and by judicious forcing may be had in abundance at Easter. It will last well in almost any situation when in bloom. It is besides perfectly hardy, and as such can be grown on the open border.

Strong elimps for foreing ... each 9d.; per doz. 6s.

per 100. per doz.

NEW AND SPECIALLY RECOMMENDED VARIETIES.

WE have much pleasure and confidence in recommending the following as being really first-class varieties, and especially worthy of notice.

Freesia Refracta Alba.

Too much cannot be said in favour of this exquisite floral gem, which should be freely grown wherever there is a cool pit, frame, or greenhouse. The plants grow about nine inches high, the flowers being a beautiful pure white, blotched with yellow on the lower petals; most deliciously fragrant and are charming, and will last for a long time as cut flowers. By successive pottings this may be had in bloom from Christmas to nearly Midsummer, at a season when white flowers are most acceptable. The most suitable soil is fibrous loam, and leaf mould, with a little well-decayed manner and sharp sand. Plant five or six bulbs in a 5-inch pot, and place them in a sunny position in a cool pit or frame, do not water till growth commences, then give air but avoid draughts; as the plants advance in growth they may be removed to the greenhouse for flowering, keeping them as close to the glass as possible. Weak liquid manner may be given with good effect when the plants have formed the flower spikes, and a temperature of 60 to 65 degrees will bring them nicely into flower and early.

Extra fine cultivated Roots, per 100, 17s. 6d.; per doz. 2s. 6d.

LILIUM LONGIFLORUM HARRISII

(THE BERMUDA EASTER LILY).

A magnificent variety of the Longiflorum type but more floriferous, and the flowers are larger and of greater substance.
The blooms are pure white, four to five inches in length,
and deliciously fragrant. A splendid variety for pots and
first-class for foreing. Potted up in September may be had
in bloom at Christmas and the New Year, and by a few
successive pottings and gentle forcing a supply of charming
flowers may be kept up throughout the Winter. Having
made large purchases of this superb Lily, direct from
Bermuda, we are enabled to offer at the following low rates:—

Fine Bulbs, 5 to 7 inches in circumference
Each 9d.; per doz. 7s. 6d.; per 100, 56s.
Extra fine Bulbs, 7 to 9 inches in circumference
Each 1s.; per doz. 10s. 6d.; per 100, 80s.

GALANTHUS ELWESII

(ELWES' GIANT SINGLE SNOWDROP).

The largest, most handsome, and distinct of all Snowdrops. The dark green blotches on the tube, and the snowy whiteness of the large globular petals, render the blossoms extremely effective, whether growing in beds, as edgings or masses, or as cut flowers for vases. Price per 100, 5s. 6d.; per doz. 1s.

ANEMONE.

FULGENS. The brightest scarlet and most graceful of all Anemones for Winter and Spring-flowering; successional plantings will secure flowers from Christmas to Autumu. An invaluable Market flower.

Price per 100, 10s. 6d.; per doz. 1s. 6d.

,, GRAECA. Rich deep glowing crimson scarlet flowers, with fine broad petals. Price per doz. 2s. Gd.

"Glory of the South" (new). Large handsome brilliant searlet flowers of fine substance, with broad petals and rich blue-black central boss. This is a grand Market flower.

Price per doz. 28. 6d.

ERYTHRONIUM DENS CANIS GRANDIFLORUM ALBUM.

A superb variety of the well-known Dog's Tooth Violet. Broad leaves handsomely spotted and marbled purple. Flowers large pure white with yellow eye, splendid.

Each 6d.; per doz. 5s.

SPIRÆA ASTILBOIDES.

This is one of the most handsome of hardy herbaceous percunials, and has been certificated both by the Royal Horticultural and the Royal Botanie Societies on account of its great merit. The stems grow from two to three feet high, and are terminated by compound feathery branches of elegant white flowers, which are produced in the greatest profusion. A charming and effective plant for pot culture, and much superior in appearance to the old Spiraca Japonica.

Each 1s. 6d.; per doz. 15s.

CHIONODOXA.

GIGANTEA (uew). First Class Certificate, Royal Horticultural Society, March, 1891. A very beautiful species, totally distinct from *C. Luciliæ* or *Sardensis*. The flowers are very large, and of a beautiful soft grey-blue, with white centre. A most valuable addition to our Spring flowers.

Price per 100, 15s.; per doz. 2s. 6d.

SARDENSIS. Awarded a First Class Certificate, 1885, by R.11.S. The flowers are of an intense deep true-blue colour. It blooms in early Spring with the Snowdrop, and, like C. Luciliæ, is one of the most effective of Spring flowers for edgings and masses. Its brilliant colour catches the eye at a great distance. Price per 100, 6s.; per doz. 1s.

FRITILLARIA ARMENA.

A charming dwarf species, hearing elegant small deep yellow bell-shaped flowers. A gem for rockeries, where it should be planted in clumps. Home grown Bulbs. Price per 100, 15s.; per doz. 2s. 6d.

MONTBRETIA POTSII GRANDIFLORA.

Resembles a miniature form of Gladiolus; perfectly hardy, and most valuable for the herbaceons border and shrubbery; beautiful large flowers, golden yellow inside, outside bright red; very effective.

Each 9d; per doz. 7s. 6d.

PRIMULA—DOUBLE PURE WHITE.

These are exceedingly valuable for furnishing an abundance of cut flowers throughout the Autumn and Winter, for which purpose the plants we offer have been specially prepared.

Well-rooted strong young plants, from three-inch pots, Per 100, 42s.; per doz. 6s.; three for 1s. 9d.

New Roses, &c.

NEW MOSS ROSE—CRIMSON GLOBE.

A splendid new hybrid. The buds are nicely mossed, the flowers are of a deep, rich crimson colour, large, full, and globular; whilst the growth is very vigorous. This magnificent variety will be a great acquisition to the Moss Roses, as it possesses the qualities of a show flower combined with the true moss characteristics. Has been awarded a First Class Certificate by the Royal Horticultural Society.

Each 3s. 6d.

MARCHIONESS OF LORNE (H.P.).

This beautiful Rose, dedicated by special permission to Her Royal Highness the Princess Louise, Marchioness of Lorne, produces flowers of an exceedingly rich and fulgent rose colour, slightly shaded in the centre with vivid carmine. They are large, full, of finely cupped shape, and very sweet, the petals are large, the buds long and handsome. It is specially remarkable for its truly 'perpetual' habit, every shoot being crowned with a flower bud. Received an award of merit from the Royal Horticultural

SALAMANDER (II.P.).

Flowers bright scarlet crimson, very vivid in Summer, and deep and glowing in colour in Autumn, large and full; outer petals finely reflexed, and centre petals standing well up; all of fine substance, exceedingly free in blooming, of fine foliage and habit, and of strong growth, with a good constitution. A brilliant and most effective Rose either for garden decoration or exhibition. and quite first-class. Awarded the National Rose Society's Gold Medal, July 5th, 1890. Each 10s, 6d,

WABAN (Text-scented).

A sport from Catherine Mermet, and which originated with Messrs. Wood and Co., at the Waban Conservatories, Mass., U.S.A. The following is Messrs. Wood's description—"In foliage and vigour Waban resembles its parent; thowers borne on long, strong stems, in form somewhat larger and exceeding in size and number of petals. Colour, carmine pink (and when we say carmine we mean all that the word implies), splashed with flaming madder-red, shaded brilliantly upon outside petals, colour increasing in intensity towards end of petal, and as you approach the centre of the bud each petal increases in intensity of colour. Reflex petals more delicate in colour, but shaded stronger at the end of petal. From our knowledge and experience in the growing of Roses we do not hesitate to say that this Rose is one of the greatest acquisitions to the tea family, and is the finest

which has yet come to our knowledge. It is a gem in every way, and we are more pleased with it than ever."

It has received the Highest Award of the Massachusetts Horticultural Society (Silver Medal), and a Silver Medal from the Pennsylvania Horticultural Society of Philadelphia, together with Certificates of Merit; also many Certificates of Merit from other Horticultural Societies in Canada and the United States.

Each 7s. 6d.

CALLA ÆTHIOPICA—LITTLE GEM.

A charming miniature variety of the well-known "Arum Lily," growing only about one foot high, and bearing flowers of a purer white than those of the old variety. This will be found a pretty and easily grown plant, well suited for window or conservatory decoration, and especially useful where cut flowers are in demand. Was awarded a Special Certificate by the Royal Horticultural Society, October, 1890. Each 2s. 6d. and 3s. 6d.

NEW STRAWBERRY—LAXTON'S SCARLET QUEEN.

The raiser in introducing this new Strawberry thus writes of it-"A most noble Strawberry! An early and better flavoured 'Paxton,' and the tuest early variety yet introduced. Very early, large, bright coloured, richly tlavoured, and of handsome appearance. Plant vigorous and prolific."

Each 1s. 6d.; per doz. 12s.

NEW APPLE—VICAR OF BEIGHTON.

We have much pleasure in introducing this fine Apple to the horticultural public, who, we feel sure, will highly appreciate its many good qualities. A seedling raised in the Vicarage Gardens at Beighton, Norfolk, it has proved itself one of the handsomest, most prolific, and best keeping Apples in cultivation. The fruit is large and roundish, and when ripe of a deep bright crimson colour, mottled, and striped with yellow and green, giving it the most beautiful appearance, which if well kept, it retains till April or May; whilst its pale yellow tesh is of tine flavour, juicy, and all that can be desired in a first-class kitchen Apple. Will prove a most valuable sort for market growers on account of its very handsome appearance and excellent keeping qualities. Dwarf bushes or maidens, each 2s. 6d.; Pyramids, 5s.

NEW APPLE—BEAUTY OF BATH.

This fine new early Dessert Apple, on account of its earliness, extremely handsome appearance, good flavour, and free cropping qualities, will eventually, both for market purposes and private use, take the leading place among first early Apples.

The "Beauty of Bath" is fit for use at the end of July and early part of Angust. It immediately follows the Juneating, and is earlier than the Irish Peach, from which it is quite distinct. The fruit is of medium size, round and tlattened, the ground are restlement, and proposed the suns the flesh is firm and note yellow and it. colour a yellowish green, beautifully striped and spotted with crimson toward the sun; the flesh is tirm and palo yellow, and it has a brisk, snb-acid flavour far superior to that of other early Apples. It is a certain and free cropper. Our stock trees have not failed once during the last six years, and it will on this account be a valuable market variety.

Strong maiden trees, each 2s. 6d. and 3s. 6d.

Remarks on Cultivation, &c.

A HYACINTH FARM NEAR HAARLEM.

CULTIVATION OF HYACINTHS.

The Hyacinth is as couspicuous amongst early Spring flowers as is the Rose amongst our Summer favourites. It is preeminently "The Flower of Spring," and richly does it merit
this high distinction, for few classes of plants, if any, embrace
at once so wide a range of beautiful and distinctive variety of
colouring with such delicious fragrance as is common to them
all. No plant can be grown to so high a state of perfection with
so little trouble, or will adapt itself so readily to almost any
system of what may be termed artificial culture; grown in-doors
in pots, pans, boxes, and glasses, jardinettes, baskets, in soil,
cocoa-nnt refuse, or damp moss, or out of doors on the open
border, it appears equally at home, and will bloom "free and
fragrant," as if grateful for the small amount of attention it
receives. The Hyacinth forces well, and by judicious treatment
may be had in bloom by Christmas, but "forced" spikes of bloom
are not generally so fine as those which develop more slowly in
the cool house, pit, or frame. Pot culture is by far the most
important and successful of the many ways adopted in growing
Hyacinths, and cultivated in this way no plant will produce
more splendid effects in the greenhouse or conservatory in the
Spring months, or is so indispensable as a window plant. Single,
or double, they are all exceedingly beautiful, but if there is any
excuse for distinction, the single-flowered varieties must bear
away the palm for elegance and brilliancy, and perhaps for
fragrance, although the individual bells are not always so large.

In selecting Hyacinth bulbs, it should be borne in mind

In selecting Hyacinth bulbs, it should be borne iu mind that the largest and finest-formed are not always those which produce the finest spikes of bloom; for, although some are possessed of both these qualities, many of the finest varieties have rough, and in some instances, small and ill-shapen bulbs; all must, however, be well-ripened, firm, and solid, to produce really good flowers.

Cultivation in Pots.—Although the Hyaciuth will ordinarily thrive in any good, light, rich soil, a long experience has taught us that the best possible mixture for growing Hyaciuths in pots consists of about one-third each of good fibrous loam and well-decayed cow-dung, and the remainder of about equal parts of coarse gritty saud and leaf-mould. Thoroughly mix these at least a month before potting, keeping the mixture in a cool shed, or where it is not exposed to the weather. Forty-eight sized pots (five-inch) are generally preferred, but we have seeu magnificent Hyacinths grown in much smaller, some indeed preferring three-and-a-half-inch pots for ordinary decorative purposes; where fine selected bulbs, however, are grown for exhibition, thirty-two sized (six-inch) are not considered too large. In potting, the soil should be in a moderately moist conditiou, and great care should be taken to ensure perfect drainage. Prepare the pots by placing a large hollow crock at the bottom, and a few smaller round it, and on these a little rough rich manner, or a few pieces of charcoal. Use the soil in its rough state as mixed, filling the pots quite full; take each bulb firmly in hand and press it well down into the soil, and finish off by firmly pressing down the soil round the bulb and filling up level, leaving the crown of the bulb just visible. After potting select for them a cool, sheltered position out of doors, and place them on a layer of coal ashes, cocca-nut fibre, tan, or any similar light material, covering the pots with the same to the depth of five or six inches, and placing over them a few boards or slates to keep off excessive rains. In about four or five weeks they will be found on examination to be nicely rooted, and those required for earliest blooming may be removed to the cool pit or frame preparatory to foreing, or their removal to the greenhouse; or they may remain in the plunging material and be brought forward as required in succession for later blooming; all should, however,

be removed before they push their way through, and be gradually introduced to light and air, keeping them in a cool shady position till the loaves have fairly acquired their proper greenness. It may be bere remarked, that a slow and steady development is at all times preferable for the production of really fine spikes of bloom; and that although the Hyacinth forces well, it should never be subjected to a higher temperature than seventy degrees, and should be removed from this to a cooler atmosphere as soon as the flower-spikes are formed, or a weakly growth of plant with a poor colour of flower will be the probable result. Hyacinths delight in an abundance of root moisture when growing, and are much improved by frequent mannire waterings, and keeping the surface soil of pots loose by occasional stirring. Keep near the glass, give plenty of air, and tie to neat stakes if the spikes become too tall. A slight shading when in flower will assist in lengthening the time of blooming.

Time of Planting.—Those intended for early forcing should be planted in September, but October is decidedly the best month to plant for a general display in the greenhouse, etc. For later Spring-blooming a planting may be made about the second week iu November, but late flowers may always be bad by keeping back a few of the earlier-planted in a cool frame.

Cultivation in Glasses.—The single-flowered varieties are at all times to be preferred for this purpose. Fill the glasses with pure river or rain water so as to almost touch the base of the bulb, and place a small pieco or two of charcoal in each to keep the water pure, after which place them in a cool dark closot for a few weeks, or till their roots have nearly reached the bottom, when they should be gradually brought to the light. As growth advances they should be kept as close as possible to the glass, have plenty of air and the benefit of wire supports before the spikes become top-heavy, replenishing the glasses from time to time as the water becomes absorbed. As Hyacinths in glasses will not thrive in rooms that are at times excessively heated by gas, etc., they should be removed at such times as occasion may require, but should never be subjected to great or suddon heat or cold.

Cultivation in the Open Ground.—Few objects are more boautiful in Spring than beds of choice Hyacinths, either in distinct colours or mixod. They succeed well in any good garden soil, but have a decided preference for that which is well-drained, light, and rich. Fork up the ground to the depth of eighteen inches, adding a liberal quantity of well-decayed manure, and if the ground is heavy a good portion of coarse sand. Plant the bulbs as early as convenient in October, about six inches apart, and with their crowns at loast four inches below the surface; no protection will be necessary unless in very exposed situations, and then only in extremely severe weather. When blooming is over, and the leaves show signs of decay, the bulbs may be lifted to make way for the Summer bedding plants, and stored in a eool, dry place for future planting.

Early Roman Hyacinths.

This delicionsly fragrant and very early flowering variety should be much more extensively grown than it is at present. By planting early in September and gently forcing, the Early White Roman may be had in bloom in November, and a few successive plantings at intervals of about a fortnight will ensure a continuance of bloom till after Christmas. Both in bulb and flower they are smaller than the ordinary Hyacinth, and should consequently be planted five or six in a pot. The delicately scented pure white flowers, which are produced in great profusion, are exceedingly valuable to cut for bouquets, &c., coming at a season when there is usually a great scarcity.

Tulips.

Nothing can surpass the brilliant and charming effect produced by the judicious planting of these in beds of woll solected colours and varieties, and grown in this way or planted in clumps or lines of distinct colours, in association with Narcissi and other Spring flowers, or as broad marginal lines in front of shrubbery borders, their effect when in bloom is strikingly beautiful. Tulips are perfectly hardy and are easily cultivated, and will grow to perfection out of doors in almost any soil that is fairly rich and open and not too wet; a light rich sandy soil

is, bowever, the best, and if possible an open snnny position should be selected for them, where they are sheltered from entting east winds in Spring. The hest time for outdoor planting is in October or November, and the bulbs should be planted at a depth of four or five inches and about six inches apart. No after culture is necessary, heyond a slight stirring and regulating of the surface of the beds with the point of a trowol or anything similar, when the plants are fairly abovo the ground. When blooming is over and the leaves show signs of decay, they may, if necessary, be carefully taken up and stored, to make room for the Summer bedding plants. When grown in pots they should be potted firmly three to five or soven bulbs in a pot, according to size and the soil used, and their after treatment may be precisely like that adopted for Hyacinths. For forcing purposes the Van Thols are the earliest, and by early potting and gentle forcing these may be bad well in bloom at Christmas. The Pottebakkers, from their earliness and dwarfness of habit also rank high for this purpose; but all the early single-flowered varieties are almost equally suitable, as are also many of the earlier double-flowered section, notably the Tournesols, Blancho Hative, Imperator Ruhrorum, and Duc van Thol. Planted closely in shallow trays or boxes of light rich soil or well-decayed manure and leaf-mould, and placed in a gentle heat, early Thlips are exceedingly useful to transfer, when coming into bloom, to jardinottes, hanging-baskets, &c., filled with cocoa-nut refuse or soil. Generally speaking the single-flowered varieties are by far the most brilliant and showy for outdoor planting, although perhaps individually not so massive and rich in appearance or so durable as the double-flowered sorts. The fine old species "Gesneriana," with its dazzling crimson flowers, is the best of all the late varieties: it is somewhat tall, but grown in large beds or masses is grandly effective; it also possesses the merit of being very cheap.

Late, or Florists' Tulips.

This fine old class of Florists' Flowers, good collections of which have become scarce of late years, was formerly held in high estimation amongst the English and Continental Florists, who at times paid enormous prices for particular varieties when adding to their collections. But although not now so much grown as formerly, late Tulips are well worthy of cultivation, and any one having space for a Tulip bed, would be amply repaid for their small trouble by a display of rare and peculiar beauty.

October is the best month for planting, and to grow them to perfection the bulbs should be planted four or five inches deep, in well-prepared beds of at least a foot deep of sandy loam, leafmould, and well-decayed cow-dung, with the addition of a little sharp sea-sand, giving a slight protection to the beds in severe weather in Winter by a covering of litter or other light material, and if intended for exhibition, the blooms should be protected from the weather by a covering of canvas or glass. Grown in this way these fine Tulips will often attain a height of from three to four feet, bearing noble flowers, the markings and featherings of which are in many instances exquisitely beautiful. Late Tulips will, however, bloom finely with a much more easy process of culture, and are admirably suited for planting in groups on mixed beds or borders, in front of slumbs, and as they bloom later than other Tulips, they generally afford a fine display at a time when our flower beds are but poorly filled.

Polyanthus Narcissus.

This beautiful class of easily cultivated decorative plants, although perfectly hardy, is more especially suited for pot culture, and should be potted and grown in the same way as recommended for Hyacinths. They are very free-flowering, and produce heantiful trusses of deliciously-scented flowers, varying from deep orange and primrose to the purest white; all the varieties will force well, and they are exceedingly valuable for supplying cut flowers in Winter and early Spring. The Double Roman and Paper White if potted curly may be had in bloom before Christmas. With the exception of the two last named they succeed well if planted out of doors, but thrive best where partially shaded from strong sunshine.

Anemones.

The Anemone, or "Windflower," forms by far the most splendid and interesting group of our tuberous-rooted flora, and although, perhaps, not quite so chaste and elegant in the form of its individual flowers as the Ranuneulus, it certainly surpasses it in its fine effectiveness as a decorative plant. Grown in large or small beds, in patches, clumps of one colour, or mixed, they make charming groups amongst, and contrast finely with, most other plants, whilst the brilliant scarlets and fiery reds are exceedingly telling, whon planted in double lines as an edging to large or small beds, shrubbery borders, &c. The Anemone is also invaluable as a pot plant for the decoration of the greenhouse or conservatory in early Spring, and is very useful as a cut-flower, hesides being extremely hardy and easy of cultivation. The Anemone prefers a light rich loamy soil with a fair amount of moisture, and out of doors will succeed well with the same kind of treatment and soil as recommended for the Ranunculus, but any good garden soil that is not too heavy or wet will grow them well, and with bnt a small amount of trouble. For early Spring blooming plant from September to November inclusive, and for Summer and Autumn flowering plant in February, March, and April. The tubers may be planted at a depth of about three inches, and at a distance of about five or six inches between the plants. For greenhouse or conservatory decoration, the tubers should be potted in October, and placed in a cool pit or frame till February, when they should be brought into the cool greenhouse, placed near the glass, and gradually brought into bloom. When it is desirable to take up roots from the open ground after flowering, they should, if possible, be allowed to remain till the leaves show signs of deeay, when they may bo carefully lifted, and gradually dried or ripened for replanting at some l'uture date.

Winter Aconites.

The little Acouite, which blooms earlier than the Snowdrop, is invariably the first flower in the garden to greet us in the New Year, and should always be grown freely in sunny positions near the house, or walks, for the pretty and ever welcome display they make with their golden yellow flowers so early in the season. They are extremely hardy, seem to thrive in any soil or position, and planted in large permanent chumps or patches, they will grow freely under overhanging shrubs or trees, and may be left in the ground for years without injury.

Chionodoxa luciliæ.

(Glory of the Snow).

This is undoubtedly one of the most beautiful hardy Spring-flowering bulbs in cultivation, and at the same time one of the very easiest to grow. In form of flower and habit of growth it resembles the well-known and highly prized Scilla Sibirica, but its flowers are larger, more open, and of the most beantiful-sky blue colour, the centres of the flowers being of a pure white, giving the plants a striking and charming appearance. It is extremely hardy, will thrive in any fair garden soil, and is admirably suited for planting in large chumps or patches on the border, as an edging to beds, rockeries, &c., and the bulbs, if left in the ground for several years, will thrive wonderfully. It is also well snited for pot culture, and planted six or eight in a five-inch pot, has a very pretty effect in the greenhouse. When the bulbs are planted ont of doors, they should be placed not less than four inches deep, and about three inches apart, and to be effective, not less than ten to twelve should be planted in a patch.

Crocuses.

As foremost amongst the harbingers of early Spring, this beautiful class of the genus Iridacee is at once the most lovely and hardy of our vernal favonrites, and we may also add the most permanent. Almost every kind of soil or situation seems congenial to their development; but soil which is fairly light and rich, and an open sunny aspect, are requisite to grow them to their fullest perfection of size and brillianey. Planted in clumps or lines on mixed beds or borders, the pure whites, golden yellows, rich purples, soft blues, or the beantifully

peneilled "La Majestense" are all and each very handsome; but heds of purples or blues, edged with golden yellow or purples or blues, edged with golden yellow or purples or blues, edged with golden yellow or purples of colours planted in lines in front of shrubbery borders, &c., are exceedingly charming, and when expanding in the sunshine, form a sight not soon to be forgotten. Their culture is simple in the extreme. In planting out of doors, the bulbs, or more properly speaking corms, merely require to be dibbled in about three inches deep, and two or three inches apart, and left to themselves; and if they can remain where planted for two or three years all the hetter, as they will then be found to have made a good increase, and may, after blooming, be taken up, divided, and replanted. The Croeus is admirably snited for cultivation in pots, pans, window boxes, &c., and when so grown the roots should be planted closely together to produce a good effect. When in pots, six or eight roots should be planted in a pot of about five inches diameter, filled with light rich soil, and the pot plunged or buried to a depth of two or three inches in some kind of light porous soil or material, till the erowns begin to show signs of pushing through, when they should be placed near the glass and kept woll supplied with water. The fine named varieties are the best for this purpose. A few planted in shallow hoxes of rich soil will be found very nseful to lift, when coming into bloom, for planting in hanging-baskets, &c. The bulbs may be planted any time during September, October, or November; early planting is, however, much to be preferred, as those planted towards the end of the year never bloom so satisfactorily as those planted earlier in Authmm.

Crown Imperials

(Fritillaria imperialis).

These stately growing hardy plants thrive hest in a deep, rieh, and moist soil, and in a position where they obtain a fair amount of sunshine, and at the same time sheltered from high winds; they will, however, grow well in any good garden soil, and if allowed to remain undisturbed for several years, will form hape picturesque groups of rare heauty. The pendent bell-shaped flowers vary in colour from deep chocolate red to reddish buff, orange and pure yellow, and are surmonnted by a tnft of beautiful green foliage, giving the plants a fine appearance. The gold-striped, with its lovely variegated foliage, is especially handsome. The bulbs should be planted with their erowns four or five inches below the surface, and eight inches to a foot apart.

Cyclamen.

This beautiful class of Alpine plants is most admirably suited for Winter and Spring decoration of the greenhouse, conservatory, or drawing-room, and should certainly be grown wherever a cool pit, frame, or greenhouse, or even a snitable window exists. The foliage of most of the varieties is beautifully marbled, the blooms of some are deliciously fragrant, whilst all are chaste and beautiful in form and habit of growth. The corms should be potted in September or as early as convenient in October, using pots of five inches in diameter, and a soil composed of rough sandy loam two parts, leaf-mould one part, and one part of well-decayed cow manure; use the soil in a moderately moist condition, place the pots in a cool shady frame, and give but little water till growth commences; give an abundance of air and light on all favourable occasions during the Spring growth, but with as little fluctuation of temperature as possible. While the blooms are forming, water more freely as possible. While the blooms are forming, water more treety —occasionally with weak liquid manure—and keep the foliage clean by syringing or washing with a soft brush. By placing a few in a gentle heat they will bloom earlier and the display may be prolonged. As soon as they have done blooming, remove them to a cool shady frame for the rest of the Summer, keeping them uniformly and moderately moist. Early in August, or sooner if they are seen to be forming young growths, let them be at once potted, and still maintain them in a mean temperature of about fifty-five degrees, affording gradually all the light possible, oventually, as the season merges into Autumn, removing them to a warm shelf and somowhat elevated in the greenhouse. The varieties of C. Europæum and C. hederæfolium are comparatively hardy, and will succeed well, planted in shady nooks of rock-work under overhanging evergreen shrubs, &c., but where planted in more exposed positions should have some slight protection in Winter.

Eucharis.

A magnificent plant for the warm pit or stove, bearing large, pure white, wax-like flowers of beautiful form and delicious fragrance. It is undoubtedly the finest of all flowers for Winter bouquets, and by judicious forcing may be had in bloom at almost any season. Rough fibrous learn with peat and sharp sand is the most suitable, and ample drainage should be provided; the plants delight in plenty of moisture and a high temperature, and it is found that when they are kept somewhat pot-bound, and occasionally supplied with liquid manure, they bloom much more freely than when disturbed by frequent re-pottings. Where a succession of bloom is required, a portion of the plants should be rested whilst the others are being grown or brought forward by progressive stages. A few plants at a time should be plunged in a good bottom-heat in a warm pit or stove, and liberally supplied with tepid water, and after flowering placed in a cool position in a greenhouse and but moderately supplied with moisture. As the plants, however, are evergreen, water should not be withheld to an extent that will injure the foliage. By alternate growing and resting in this way, an almost constant supply of these charming flowers may be had.

Gladioli -- Early-flowering.

The carly-flowering section of Gladioli—blooming in June and July—are amongst the most graceful in growth and beautiful in colouring of any plants we possess. They are not only admirably snited for garden decoration, but grown in pots and gently forced, form charming subjects in the greenhouse in April and May, whilst their blooms are almost invaluable where an abundance of cut flowers is desired. The plants, which are very free-flowering, are of a somewhat dwarf branching habit of growth, and the blooms vary in colour from intense crimson through all the shades of rose, scarlet, carmine, purple, pink, to the pure white "Bride." The lower petals of most sorts are marked by a distinct and conspicuous blotch surrounded by a band of a different colour, giving the flowers a strikingly handsome appearance. They will thrive in almost any soil or situation, but out of doors should for preference be planted in a warm sunny position. October and November are the best months for planting, and the bulbs should be planted in clumps or patches of six or eight, and at a depth of four or five inches, covering them over in Winter with some short manure to prevent injury from frost. For growing in pots, they should be potted five in a six-inch pot, using a light rich compost and covering the crowns about half an inch deep. Place the pots on a cool shelf or under the stage in the greenhouse, and give but little water till they start into growth, when they should be placed on the stage, or as near the light as convenient. Here, with a fair supply of water, and ventilation on fine warm days, they will soon grow on into beautiful flowers.

Ixias and Sparaxis.

These beautiful free-flowering Cape bulbs are deserving of much greater attention than they have hitherto received from the horticultural public, as they afford with but very little cultural skill, an abundance of strikingly brilliant and richly coloured flowers, which apart from their elegance of form, are exceedingly valuable to cut for the decoration of the drawing-room, bouquets, &c. In the south and western districts of England they may fairly be considered as hardy, but in most other parts of the British Isles they require to be planted deeply so as to be out of reach of severe frosts, or to have the protection of a cool pit or frame in Winter. They delight in a deep, rich, sandy soil, and when planted out of doors, a warm, smnny, well-sheltered border should always be selected. They thrive well in pots of light rich, sandy soil, planted five or six in a five-inch pot, placing the pots in a cool pit or frame, and giving plonty of air on all favourable occasions. Ixias do not require so much water when growing as most plants of a similar class, and watering may be discontinued when the plants have done flowering. If planted in six or seven-inch pots, several in a pot, they may be bleomed a second year without ro-potting.

Irises.

The varieties contained in our list embrace almost as wide a diversity of nationality as of distinctive character and individual peculiarity. Collected as they are from so many parts, and from so many different habitats, it is only natural to surmiso that the Iris in its various species is adapted for a great variety of ornamental purposes in connection with the garden; and such is really the fact; for there is no garden, however peculiarly situated, but may grow, and well, some few varieties of these beautiful iridaceous plants. For light or stony soils, and indeed we may say almost anywhere the English and and indeed we may say almost anywhere, the English and Spanish in their beantiful kinds, Pavonia major, Susiana, Kampferii, Germanica, the latter class being admirably suited to all descriptions of mixed beds in light or heavy soil, and will thrive in any damp spot, or water-margin, and to which they always give a fresh and pleasing appearance. A sandy loam is, however, perhaps the best soil for Irises generally, although many of the varieties, especially those of the Kæmpferii type, will grow spleudidly in peat. The culture of all is simple in the extreme, as they merely require to be planted to ensure the most pleasing results. The varieties, one and all, are highly ornamental as decorative plants, and as cut-flowers for placing in vases, &c, the Iris has few equals; the white and pale blue being especially valuable for this purpose. The Kampferii varieties are by far the most splendid, producing handsomely-formed flowers of enormous size and of the most charming colours, ranging through all the shades of dark purple, blue, yellow, silvery-grey, and satiny-rose, to the most pure and lovely white; whilst the markings or pencillings of the flowers are in many instances exquisitely beautiful. We know of no class of flowers finer than these to cut for decorative purposes.

Lilies.

In their far distant native habitats Lilies are generally found growing in such sheltered spots as margins of woods or plantations, rocky ravines, amongst long grass, shrubs, &c., and mostly where for a long period of the year their bulbs are in a comparatively dry state. This fact points out the necessity of good drainage, and partial shade or shelter, and shows at a glance the great suitability of Lilies for planting in such places as on mixed beds or borders in front of shrubs, or amougst overgreens and roses, on Rhododendron beds, &c., and where indeed, when planted in groups of three or five, such fine varieties as Auratum, Chalcedonicum, Speciosum, &c., are matchless in their beauty, and produce a splendid and imposing effect. Planting out may take place any time during the Autumn, Winter, or Spring, when the bulbs are in a dormant state, or growth has but just commenced; but generally speaking, Autumn is the best time; and the bulbs should be planted at a depth of from six to eight inches according to size, so as to admit of their remaining in tho ground for several years, if possible without being disturbed. bilies generally are fond of a rich soil, mulchings, &c., and whether grown in-doors in pots, or on the open border, will amply ropay with an abundance of fine flowers for a plentiful supply of liquid mannre once or twice a week during the growing period, and before the plants come into bloom.

Cultivation in Pots.—For growing Lilies in pots, &c.,

Cultivation in Pots.—For growing Lilies in pots, &c., a compost of about equal parts of sandy loam, leaf-monld, and peat, will generally answer admirably; but we have seen some of the finest Auratums ever exhibited grown in pure leaf-mould. It is also worthy of note that this fine variety will succeed equally well out of doors in peat, loam, or indeed any good light soil, and is consequently unrivalled for planting on Rhododendron beds, &c. Single specimens in pots of about six inclused diameter, form beautiful objects for the drawing-room, &c., but pots of eight or ten inches diameter, with five or seven bulbs in each, are truly magnificent when in bloom, and produce an effect of "flower and fragrance" that is not soon forgotten. In potting provide ample drainage and pot firmly, placing the bulbs about two inches below the surface; after which, select some sheltored place out of doors that is exposed as little as possible to the direct rays of the sun, as the north side of a wall or fence, &c., and plunge the pots with their rims about six inches below the surface in cocoa-nut refuse, ashes, or any light material, in the way recommended for Hyacinths. Here they should remain

till-the stems have pushed their way some eight or ten inches through the plunging material, when they may be removed to the cool pit or vinery till the flower-buds begin to expand, and then removed to the corridor, drawing-room, or conservatory; or the plants may remain in the plunging material till coming into bloom, before removal to the window, &c., should there be no convenience of a forwarding place as suggested. To prevent breakago a neat stake should be placed to each stem when taken np from where plunged; and if extra fine blooms are required, a few of the weaker buds should be pinched out in such varieties as will admit of this being done. When the blooms are off, the bulbs should be gradually ripened by giving less and less water; and when the stem is quite withered, they should be stored in some cool, dry place, for future potting or planting. Lily blooms, if cut and placed in water when just expanding, will last a considerable time, and are very beautiful for table and other decorations, the pure white varieties being especially valuable for this purpose.

Lily of the Valley

(Convallaria majalis).

This beautiful and fragrant little gem is much too well known and highly popular to need any comment of ours. Planted out of doors it will succeed admirably on any shady border or spot, under or among trees, woodlaud walks, &c. A light rich loamy soil is the best; the roots should be planted about three inches deep. When grown in pots for forcing, pot them in thirty-two-sized pots filled to within about three and a half inches of the rim with rich loamy soil, upon which place the shoots or crowns closely, and then cover with about two unches of leaf-mould and sand, and give a good watering; place on a shelf near the glass in a moist stove or forcing house, keep well supplied with moisture, and soon as the plants begin to show their flower-heads, remove to a warm greenhouse, keeping near the glass till the flowers begin to expand, when they should he gradually removed to a more shady place before removal to the drawing-room, &c.

Ranunculi.

Although it is somewhat difficult to grow a large collection of choice named Ranunculi to perfection, there are many beautiful varieties of the edged, spotted, and self-coloured classes, the principal of which are contained in our list, that are easily grown, and will bloom freely in any light rich soil with a fair amount of moisture; aud, considering their chaste and elegant forms, equalling the most perfect Rose or Camellia, their brilliant and attractive colours, ranging through the various shades of crimson, scarlet, purple, yellow, and even black, to the purest white, their exquisite markings or edgings, and in some instances delicious fragrance, it is a matter of surprise that these inexpensive luxuries should not be found in every English garden. The first essential conditions in the cultivation of Ranunculi are a fresh rich soil, and an open and sunny situation. If the soil where it is intended to plaut Rannneuli is too heavy, give a good dressing of sharp sand or road silt; if too light, add a fair proportion of saudy loam. For early flowering, plant the tubers (claws downwards) in November or December in drills about six inches apart, two inches deep, with about three or four inches between the tubers in the row; to complete the operation the tubers merely require covering with fine soil and the bed to be raked level. When the plants come up in Spring they must be kept free of weeds, and the surface of the bed occasionally stirred; and as soon as large enough a rich mulching of well-decayed manure should be placed on the bed between the rows, and liberal waterings should be given in dry weather, especially about the blooming period. If not convenient to plant in Autumn, February, March, or April will do very well, but as these will bloom later, particular attention must be paid to keeping well supplied with moisture, &c. The Turban varieties, which succeed with a somewhat rougher treatment, are admirably snited for planting in clumps on miscellaneous beds or borders in association with other plants, or as edgings, &c., and are very floriferous and telling. As the tubers are liable to injury from rain, if left in the ground after blooming, they should be taken up when the foliage turns yellow or ripens, and after being gradually dried, stored away for future planting.

Scillas.

The dwarf-growing early-flowering varieties of this beantiful class, as S. sibirica, pracox, amana, and bifolia, are extremely beantiful, and should be grown freely in every garden. In height they do not exceed four or five inches, and their lovely bending sprays of rich nltramarine blue flowers appear in the greatest profusion during the month of March. They are quite hardy, grow freely in almost any soil or position, and make charmingly effective edgings to beds of Snowdrops, &c., and if planted three or four inches deep and allowed to remain undisturbed, they will come up and bloom every Spring with increasing vigour and beauty. Planted eight or ten in a six-inch pot and treated as recommended for Hyacinths, they succeed equally well, and have a pretty effect in the greenhouse. The varieties of S. peruviana and S. campanulata bloom in May and June. These are of stronger growth than the preceding, and suited to the rougher parts of the garden.

Snowdrops.

Both the single and double flowered varieties of these ever popular aud charming little "Heralds of Spring" are too well known to need any description. Snowdrops will thrive in almost any soil or situation, and best when planted in clumps and left to take care of themselves for several years in succession, when they will form handsome and increasingly large groups, which on warm, sunny banks or borders, will push forth their numerons beautiful pure white flowers early in the new year. October is tho best month to plant, and the bulbs should be placed three or four inches deep, and about two inches apart. We have seen some pretty effects produced in Spring by planting Snowdrops in various designs on lawns, grass plots, &c. The Giant Snowdrop (Galanthus Elwest), a fine variety, growing to the height of a foot, is undoubtedly the finest of all the Snowdrops. It is quite hardy, as easily grown as the common variety, and so cheap as now to be within the reach of all.

Tigridias, or Tiger Flowers.

These gorgeously beautiful Autumn-blooming plants, which are well worth a place in every garden, are quite hardy when grown in light rich soil or on a warm sunny border. March and April are the best months for planting, and they merely require to be planted four or five inches deep in clumps of six or eight roots, to ensure the most pleasing results, but when grown on heavy or damp ground they should be taken up and stored for the Winter. All the varieties are beautiful, the new creamywhite "Grandiflora alba" extremely so; the individual blooms of this variety are very large, of a beautifully creamy-white colour, conspicuously marked in the centre with red and violet, giving it the most charming appearance.

Tuberoses.

These deliciously fragrant and exceedingly useful flowers are much more easily grown than is generally supposed, and will well repay the little trouble that is necessary to have them in perfection. For early forcing pot singly into five or sixinch pots, as early in the season as the bulbs can be obtained (African-grown are the soonest procurable), and plunge in a good moist heat, withholding water till the foliage makes its appearance, when water may be given abundantly till the flower-binds are formed, when they may be removed to the greenhouse or conservatory and less water given. For Antanan blooming, pot singly into five or six-inch pots in March or April, nsing a light rich compost, and plunge the pots about six inches above their rims in cocoa-nut fibre, coal ashes, or any light material, under the stage of a greenhouse or in a cool pit or frame; when the foliage of these makes its appearance they should be removed and plunged under a south wall, removing them to the greenhouse or indoors as the flower-buds are formed. Dry roots may also be planted in sheltered places in the open ground, from the middle of April to the latter part of May, and will produce beautiful flowers in Autumn if taken up and potted when coming into flower, and will furnish a supply of valuable bloom in the greenhouse almost up to Christmas.

Daniels' Choice Flower Roots

In Collections.

Subject to slight alterations as the season advances.

We have much pleasure in recommending the following liberal collections of Flower Roots, which are in every instance carefully made up from sound picked bulbs, are guaranteed under ordinary circumstances to produce a fine variety and display of bloom, and will be found of much better quality and cheaper than those usually purchased at Sale Rooms.

Section I.

SPECIALLY ARRANGED FOR OUT-DOOR OR OPEN GARDEN DECORATION.

Packing and Carriage Free to any address in the British Isles.

No. 1 Price 63s.

"The Hyacinths I had from you last season did well, and have been greatly admired."

From Mrs. E. L. JOHNS, Crantock, Cornwall.

Apr. 2nd.

"The Hyacinths you sent me last Autumn were splondid."

Daniels' Choice Named Hyacinths.

The following list, which has been carefully revised, includes all the finest sorts noted by us during our last visit to the Dutch Bulb Grounds, besides the best of the fine Varieties shown at the Royal Horticultural Society's and other great Exhibitions during the last Spring, and we have much confidence in recommending them as the best that can be grown for Exhibition and decorative purposes.

* It is supposed by many of the inexperienced that the best Hyacinths are those which produce double flowers; this is by no means correct, there being many more of the single varieties producing fine, free, and brilliant spikes of bloom than of the double.

D denotes double, S single flowered varieties.

GENERAL LIST.-Section I.

Daniels' Choice Named Hyacinths.

IN DISTINCT AND BEAUTIFUL COLOURS, WITH NAMES, FOR BEDDING.

SPECIALLY SELECTED FOR SIMULTANEOUS BLOOMING.

These when planted judiciously in large or small beds, are very striking and effective. The single-flowered varieties being the most distinct in colour, and the best for beds, we invariably send these in preference to the double.

Early White Roman Hyacinths.

This deliciously fragrant and very early flowering variety should be much more extensively grown than it is at present. By planting early in September and gently forcing, the Early White Roman may be had in bloom in November, and a few successive plantings at intervals of about a fortnight will ensure a continuance of bloom till after Christmas. Both in bulb and flower they are smaller than the ordinary Hyacinth, and should consequently be planted five or six in a pot. The delicately scented pure white flowers, which are produced in great profusion, are exceedingly valuable to cut for bouquets, &c., coming at a season when there is usually a great scarcity.

Late or Florists' Tulips-From a Superb Collection.

The Late or Florists' Tulips, although not perhaps so neat in their habit of growth as the early single-flowered varieties, are well worthy of a place in every garden. They will thrive in any good ordinary garden soil, and when in bloom afford a rich treat in the rare and peculiar beauty of their flowers.

Extra choice mixed. From named sorts, Bybloemens, Bizards, Roses, &c. ... per 100 6s. 6d.

From Mr. JOHN RAWLINSON, Knowsley. Oct. 20th. "The Bulbs I had from you last Autumn were simply splendid,"

Narcissi or Daffodils.

The prominence given to these beautiful hardy flowers at many of our Spring Flower Shows in recent years, and the many choice and extremely beautiful varieties lately introduced and exhibited, has led to a wonderful increase in their popularity amongst the horticultural public; and it may be fairly assumed that no one having a garden can dispense with at least some few of the many choice sorts, now procurable at a moderate price. The Narcissi are extremely hardy, easy of cultivation, suitable alike for the greenhouse or the open garden, and especially valuable as cut flowers for Church or Home decoration, in which it must be admitted they are possessed of a charming beauty beyond almost any other Spring flower, imparting an air of finish and refinement unattainable by any other hardy plant in existence.

Cultivation Out of Doors.—The cultivation of Narcissi in the open garden is extremely simple, indeed, where the soil is fairly rich, and the position favourable, they merely require to be planted and left undisturbed for several years, to ensure the most pleasing results. Planted in partially shaded positions under trees, or in front of shrubs, they are equally at home, but never appear to greater advantage than when growing in substantial clumps of six or eight roots in a clump, in association with other Spring-flowering plants, and where their elegance and beauty is most attractive. Planting in the open ground should take place as early as convenient in Autumn, and the bulbs should be planted six or eight inches apart, with their crowns three or four inches below the surface, selecting if possible a partially shaded position, where the bulbs are not likely to be disturbed for a few years. Should the soil be poor, it may be enriched by the addition of some well-decayed cow dung, the best that can be used for this purpose. A top-dressing to the beds in Winter of some short manure will greatly add to their vigour, and by a few waterings with weak liquid manure, when the plants are breaking through the ground in early Spring, some grand flowers for exhibition may be had.

in early Spring, some grand flowers for exhibition may be had.

Every third or fourth year in August or September—August for choico—the bulbs should be earefully taken up, the clumps divided and replanted in the manner suggested.

Cultivation in Pots.—All the varieties contained in the following list are suitable for pot culture, and grown in this way may be had in bloom nucle carlier. Use a light rich soil, and pot firmly three or five, according to size, in a six-inch pot. Plunge the pots in some light material in the way recommended for Hyacinths, and when the roots are formed and growth has commenced at the top, remove for a few days to a cool pit, after which transfer to the greenhouse, keeping them close as convenient to the glass. After being in the greenhouse for a week or ten days, those required for carly blooming may be plunged in a good bottom-heat, and if kept well supplied with tepid water, may be had in bloom in a very short time, whilst those remaining in the greenhouse or cool pit will afford a later succession. Weak doses of liquid manure may be given with advantage whilst the plants are growing, but should be discontinued before the flowers expand. The beautiful little white N. triandrus and the miniatures juncifolius and eyclamineus, having very small bulbs, should be planted eight to twelve in a six-inch pot, and have a very pretty effect when in bloom. Blooms required for decoration are best cut just before they expand, and placed with their stems in water in a cool room: they will soon open to their fullest extent, and will retain their freshness and beauty for a much longer time than if remaining on the plant.

Choice Narcissi in Collections.

From a horticultural point of view, nothing can be more interesting than a well-grown collection of these beautiful hardy flowers. We have therefore much pleasure in recommending the following choice collections of Narcissi, which are carefully made up to ensure the best variety, and according to price, will include such fine varieties as Horsfieldi, Emperor, Pallidus præcox, Sir Watkin, Rugilobus, Moschatus, Barri conspicuus, Empress, Countess of Annesley, Princess Mary, Princeps, Obvallaris, Bulbocodium, Poeticus ornatus, and other fine sorts, from the Leedsi, Incomparabilis, and Trumpet sections.

Oct. 15th.

"Your Bulbs to hand last week are very satisfactory, I shall recommend them to all my friends."

From JOHN LOW, Esq., Perth.

Jan. 14th.

"All the Seeds and Bulbs I have had from you for years have done splendidly, and have been very much admired."

Chinese Sacred Narcissus

Oriental Lily or "Joss Flower."

This beautiful variety is grown by the Chinese, according to the ancient custom, to bloom at the advent of their new year; it is highly prized and called by them "Joss Flower" or Flower of the Gods. The bulbs are specially grown, by a method known only to themselves, whereby they attain great size and strength, insuring luxuriant growth and a remarkable profusion of bloom in a very short period; they are generally flowered in shallow ornamental bowls containing water, the bulbs being surrounded by bright colored pebbles, to prevent them from toppling over when in bloom; the flowers which are borne in clusters on tall spikes are white with a golden yellow centre, and deliciously fragrant; the bulbs will bloom in from six to eight weeks' time after planting, and with a few bulbs started at intervals of about four weeks, a succession of flowers may be had throughout the winter.

Each 1s.; per doz. 10s. 6d.

Polyanthus Narcissus

(Bunch-flowering or Tazetta).

A BEAUTIFUL free-flowering class of easy cultivation, deliciously scented, and admirably suited for growing in pots or in water. They produce handsome trusses of elegantly-formed flowers varying in colour from deep orange and primrose to the purest white. With the exception of the Double Roman and Paper White varieties, they will sneeced well planted out of doors, but thrive best where partially shaded from strong sunshine. Generally speaking, they will thrive under the same treatment as that recommended for Hyacinths. For pot culture a light and rich soil is the best, and they should be potted as early as convenient in the season, if intended for blooming before Christmas. Pot the bulbs singly, according to size, into pots of four or five inches diameter, or three in a pot of seven inches diameter; pot firmly, and bury the bulbs well up to the crown. The pots should now be plunged six or eight inches deep in some light plunging material out of doors, and, in a few weeks, when the pots are filled with roots and top growth has commenced, they may be removed from the plunging material and placed in a cool pit or frame. Any required for early blooming may, in a few days, be removed to a gentle heat and gradually forced into bloom. The very early varieties, Paper White and Double Roman, are, however, the best for this purpose, and may easily be had in bloom in November, and with these and a few successive pottings of the other sorts a beantiful succession of bloom may be had up to March or April. The Polyanthus Narcissus submits readily to being grown in water, and if started in darkness and treated precisely in the way recommended for Hyacinths, will grow capitally and give the most pleasing results.

Winter Aconite.

Almost, if not quite the earliest amongst bulbs, is the simple and singular Winter Aconite—a veritable Christmas Rose in miniature! Seeming to care little for culture, it is an ever-constant messenger, as it were, that precedes the Scilla, Snowdrop, and Crocus. It thrives freely in every kind of site or situation, and may well be scattered among beds of later subjects; may be applied, in fact, as rows, or to grow under overhanging trees. If it has a preference it is for a moist soil, wherein it thrives and succeeds admirably.

Gladioli—Early-flowering Varieties.

BEAUTIFUL early Summer-flowering varieties, blooming in June and July: invaluable for cut flowers, the pure white variety of Colvilli—"The Bride"—being particularly useful for this purpose. Grown in five or six-inch pots, three or five in a pot, and treated in a similar way to that recommended for Hyacinths, may be had in bloom in the cool greenhouse or conservatory in April and May. The varieties of Colvilli and Cardinalis should be planted in October, the others from November to March, and the bulbs should be planted at a depth of about six mehes.

Carefully arranged Collections of Lilies, 6s., 9s., 12s., 18s., 24s., and 30s. per dozen.

Irises.

THE new Japanese Iris (I. Kæmpferii) form a splendid group of extremely beautiful and distinct varieties, the flowers of some of which attain an immense size, from six to ten inches across, and the colours vary from crimson, blue, purple, rose, to the purest white; a rich moist loamy soil with partial shade is the most favourable. All the Irises are perfectly hardy, and will thrive in almost any soil or situation, those of the Germanica and Kæmpferii types are however the best for planting in damp soil by water margins, &c., where they always have a fresh and pleasing appearance.

Miscellaneous Bulbs, Plants, &c.

BRODIÆA COCCINEA.

Achimenes. When well grown there are few more cnimenes. When well grown there are few more singular or pleasing plants than are the Achimeues. They require a very free open soil, consisting of two parts moderately decayed leaf-mould, one part peat soil, and a very slight addition of sandy particles. A high moist heat of seventy-five to eighty-five degrees suits them best, though they may be grown moderately well in teu or fifteen degrees less heat, if kept close and damp. They are particularly well adapted for hanging-baskets and all similar situations.

Twelve in six choice named sorts 3s 6d

Twelve in six choice named sorts, 3s. 6d. Very choice mixed, from our beautiful collection.

Allium. A beautiful class of hardy showy plants that are deserving of extensive cultivation.

The finest of the family. Flowers in Acuminatum. dense umbels of rich rosy crimson, very beautiful.

Per doz. 6s.; each 8d.

Azureum. Large umbels of deep azure-blue coloured flowers, borne on spikes two to three feet high.

Per doz. 6s. 6d.; each 8d.

Moly (luteum). Bright yellow flowers in umbels.

Per doz. 1s. 3d.; each 2d. Neapolitanum. Pure white, excellent for houquets.

Per doz. 1s.; each 2d.

Alstræmerias. Choice mixed. Showy plants for a warm dry border. Planted uine iuches deep they may remain undisturbed for years, and will bloom abundantly. Per doz. 2s. 6d.

Arum (Calla). Æthiopicum (Lily of the Nile).

The well-known common or White Arum, excellent as a pot plant for the greenhouse or window. Per doz. 5s.; each 6d.

Amaryllis. Formosissima (The Jacobea Lily).
Rich erimson. Per doz. 5s.; cach 6d. Per doz. 5s.; cach 6d.

Lutea (syn. Sternbergia lutea). Yellow, fine dwarf
Autumn bloomer. Per doz. 2s.; each 3d.
Purpurea (Vallota) (The Scarboro' Lily). Bright

searlet crimson. Each 1s., 1s. 6d., and 2s. 6d.

Hybrids of Vittata. A magnificent class of hardy
bulbous-rooted plauts, with large Lily-like, brilliantly
coloured flowers, admirably suited for pot culture in the greenhouse, forcing-house, ac.; vol. of Choice named varieties, our own selectiou.

Each 5s., 7s. 6d., and 10s. 6d. to 200s.

Very flue mixed; beautiful large-flowered varieties.

Per doz. 25s. aud 30s.

Babianas. Charming spikes of brilliant variously coloured flowers, somewhat like Ixias. They require thorough drainage, when planted in the open border, where they should be placed six or seven inches deep, and covered so as to protect them from injury by very severe frosts and wet weather. Dry them off as soon as first symptoms of ripening take place (when growing in pots), and do not water them in the Spring until growth actively commeuces. Choicest mixed, per 100, 6s.; per doz. 1s.

Brodiæa coccinea. Long tubular flowers, rich crimson aud green, beautiful for pot culturo. Each Gd.

Begonias. Tuberous-rooted Hybrids. We have many thousands of our superb strain of these now growing at our Nurseries, and of which dry roots can be supplied in November or December at the following

Single mixed. Very choice varieties and most beautiful colours. Per 100, 40s, and 68s.; per doz. 6s, and 9s.

Double mixed. Very choice varieties, selected flowers. Per doz. 9s. aud 12s.

Calochortus (Californian Butterfly Tulips, or Mariposa Lilies). An exceedingly brilliant genus of half-hardy bulbous-rooted plants, the flowers somewhat resembling Tulips in form, and the colours rauging from pure white through all the most beautiful shades of lilac, blue, crimson, yellow, &c. Will succeed well planted on a warm dry border, if the roots have some slight pro-tection in winter, or they will bloom freely in pots in

a cool pit or greenhouse.

Albus. Pure white ... per doz. 7s. 6d.; each 9d. Cæruleus. Rich blue ... , 7s. 6d.; 9d. Pulchellus. Golden yellow , 7s. 6d.; 9d. Splendens. White, spotted crimson , 7s. 6d.; , 9d. Venustus. White and crimson , 7s. 6d.; , 9d. Very choice mixed. ... per 100, 40s.; per doz. 6s.

livia (Imantophyllum) miniatum. Valuable greenhouse plant, producing large corymbs of delicate reddish orange Lily-shaped flowers, most effective and beautiful Each 5s. and 7s. 6d.

Colchicum speciosum. Beautiful large-flowered hardy plant from Asia Minor, producing noble Crocus-like bright rosy purple flowers in Autumn and having handsome foliage in Spring. Will thrive in any soil where undisturbed; splendid for clumps on the mixed border. Per doz. 8s.; each 9d.

Dahlias. Show and Fancy. Pot roots. All the newest and choicest sorts; a very fine collection

Per doz. 6s., 9s., and 12s.

Erythronium Dens Canis (Dog's-tooth Violets). Beautiful plants for clumps or edgings on the mixed border. Large, heavily marbled and spotted leaves; the flowers, which are very handsome, somewhat resemble the Cyclamen.

White, purple, or mixed. Per 100, 7s. 6d.; per doz. 1s.

Miscellaneous Bulbs, Plants, &c. (continued).

GRAPE HYACINTHS

Eucharis. Amazonica. Large pure white flowers; splendidly scented. Each 1s. 6d., 2s. 6d., and 3s. 6d. Candida. An extremely beautiful species from British Columbia, flowers smaller than those of the preceding; invaluable for bouquets. Each 1s. 6d. and 2s. 6d. Sanderi. Very fine new variety. 2s. 6d. and 3s. 6d.

Eucomis punctata. A fine and strikingly singular Autumn blooming hardy plant, throwing up long spikes of waxy greenish white flowers, surmounted by a tuft of leaves. Per doz. 5s.; each 6d.

Freesia. Beautiful half-hardy plants, elegant in habit of growth and deliciously scented; invaluable for bonquets, the blooms lasting in perfection for a long time after being cut; splendid for the cool pit or greenhouse. Potted six or eight bulbs in a five-inch pot of rich turfy loam, at intervals from September to the end of the year, and placed in a warm greenhouse, they may be had in bloom from January to May. Liberal waterings should be given when growing.

Leichtlini. Yellow and orange; deliciously scented.

Per doz. 2s. 6d. major. A very fine variety of the preceding.

Per doz. 3s. 6d. Refracta alba. Pure white, deliciously fragrant; a gem fer cutting. Per doz. 2s. 6d.

Fritillaria meleagris (Varieties mixed).

Beantiful hardy border plants, throwing up slender stems about two feet high with bell-shaped flowers, beautifully chequered and euriously marked. Choicest mixed, per 100, 7s. 6d.; per doz. 1s.

Habranthus fulgens pratensis. Certainly the most brilliant amongst rare hardy bulbs that has been introduced to our gardens for many years, admirably figured in The Garden, vol. xix., Dec. 7th, 1878. Its gorgeous Amaryllis-like flowers are borne in clusters of five to seven on a stem, and are each four to five inches across, of a shining bright searlet with a yellow base.

Hyacinthus candicans. A noble plant, perfectly hardy, magnificent when grown for greenhouse or conservatory decoration, sending up splendid spikes, three to four feet in length, of white bell-shaped flowers, blooming in Per doz. 3s. 6d.; each 4d.

Ixolirion Tartaricum. A beautiful hardy bulbous plant from Asia Minor, growing about eighteen inches high, and bearing numerous flowers of a rich purplish blue colour, on long stalks. First class for cutting, and will last a long time. Per doz. 6s.; each 8d.

Lachenalia Nelsoni. Deep golden yellow tubular flowers; very beautiful. A gem for pots in the cool

Choice mixed. Very pretty for pots in the cool greenhouse

Per doz. 5s.

Leucojum vernum (Snowflake). The individual flowers are like the Single Snowdrop, though borne several together npon tall spikes about fourteen inches high. They are very pretty in beds or borders, blooming generally during the month of May. Quite hardy.

Per doz. 1s. 6d.; each 3d.

Lily of the Valley (Convallaria majalis). Fine strong clumps of the best variety for forcing.

Per doz. 10s. 6d.; encl. 1s. Single Shoots, German. Produce splendid heads of bloom, much superior to the Dutch.

Milla laxa. Unabels of rich purple flowers; very hardy.

Capital decorative plant. Per doz. 5s.; each 6d.

(Triteleia) uniflora. This has fine, substantial, and lasting flowers of beautiful whitish-lilae colour; makes a fine edging, and when a score or more bulbs are grown in a large pot, forms a most striking and desirable object for the decoration of either greenhouse or conservatory. Per 100, 3s.; per doz. 6d.

Muscari (Hyacinthus). Excellent Spring-flowering plants for pots or border-culture. The Feathered Hyacinth has large handsome feathery plumes of flowers. The Grape Hyacinth has its bells compactly arranged, so as to somewhat resemble the fruit from which it takes its name; whilst the Musk Hyacinth is esteemed for its peculiar and delicious scent.

Botryoides cærulea (Blue Grape Hyacinth). Per 100, 2s. 6d.; per doz. 6d. Per doz. 2s. 6d.

blne.

pallida. Pale blue.

pallida. Pale blue.

pallida. Pale blue.

pallida. Per doz. 2s. 6a.

s. 6d.

Moschatus major (The Musk Hyaeinth). Purplish brown.

Per doz. 7s. 6d.; each 9d.

Plumosum monstrosum (The Feathered Hyaeinth).

Purple.

Purple.

Per 100, 7s. 6d.; per doz. 1s.

Nerine. Fothergilli. Requires protection of a frame, or is quite at home in any corner of greenhouse; its beautiful vermilion scarlet flowers render it valuable for conservatory decoration. Each 2s. 6d.

Ornithogalum. Arabicum. Beautiful large white flowers, with black centre. Per doz. 2s. 6d. Umbellatum (Star of Bethlehem). Well known showy dwarf plant blooming in May.

Per 100, 4s. 6d.; per doz. 8d.

A beautiful and showy class of hardy plants admirably suited for pot culture.

Bowei. A fine large-flowered variety, bearing a profusion of bright rosy flowers. Per doz. Is. 6d.; each 3d. Floribunda rosea. Bright rosy pink, exceedingly free-flowering. Per doz. 2s.; each 3d.

10 and fine variety. Por doz. 2s. each 3d.

and fine variety. Per doz. 2s.; each 3d. Rubella. Bright crimson, very showy.

Per doz. 2s.; each 3d.

Miscellaneous Bulbs, Plants, &c. (continued),

LACHENALIAS.

ZEPHYRANTHES.

Pansies and Violas. Autumn is the best time for planting Pansies and Violas where a really good effect is desired in the Spring. September is the best month, but any time up to the middle of November will do.

Blue King. Magnificent variety, producing an abundance of large deep ultramarine blue flowers, which continue from early Spring till late in Antunn; should be in every garden.

Per 100, 16s.; per doz. 3s.

Cliveden Purple. Fine large flowers of a rich bright purple colour, a constant bloomer.

Per 100, 15s.; per doz. 2s 6d.

Cloth of Gold. Beautiful bright yellow, with dark centre, very effective for Spring gardening.

Per 100, 16s.; per doz. 3s.

Dean's White Bedder. Very fine.

Per 100, 25s.; per doz. 4s.

Pilrig Park. Large pure white, pencilled violet. Fine, per doz. 6s.; each 9d.

Puschkinia libanotica. Flowers white, shaded blue. A dwarf-growing charming little bulbons-rooted plant, somewhat resembling the Scilla. Per doz. 2s. 6d.

Schizostylis coccinea. A remarkably handsome, perfectly hardy evergreen bulbons plant, producing occasional spikes of the most lovely crimson flowers, and it can be potted up in the Autumn for honse decoration similarly to the Chrysanthemum, and with equal success.

Per 100, 7s. 6d.; per doz. 1s. 6d.

Sparaxis. A section resembling Ixias, but with very fine large blooms, and is most effective in regard to a rare combination of parti-coloured hues. Choicest mixed, per 100, 5s.; per doz. 9d.

Spiræa. Japonica (Astilbe barbata). Perhaps the most elegant and useful of all plants for early forcing. most elegant and useful of all plants for early forcing. Lovely and chaste spikes of elegant white inflorescence, and is singularly adapted for pot display, table or hand bouquets, &c., and by judicious forcing may be had in abundance at Easter. It will last well in almost any situation when in bloom. It is besides perfectly hardy, and as such can be grown on the open border.

Fine strong clumps, per doz. 6s.; each 9d.

Tigridias. Singularly formed and gorgeously coloured flowers, blooming late in the Summer and during Antunin. They are quite hardy, and will thrive admirably in light rich soil, and merely require to be planted to insure success.

Canariensis. Yellow, spotted with scarlet.

Per doz. 3s.; each 4d.

Conchiflora. Brilliant yellow, spotted with searlet.

Per doz. 2s. 6d.; each 3d.

Pavonia. Scarlet and orange Per doz. 1s. 6d.; each 3d. Grandiflora alba. Creamy white, spotted with red, and having a violet centre; a fino and beantiful novelty. Per doz. 4s.; each 6d.

Tritonia aurea (crocosmia). One of the strongest and most showy of its class, forming a beautiful associate with Lilium speciosum. It but needs to be treated as an evergreen to insure perfect success in its culture. It is well snited besides for the out-door border,

Per 100, 5s.; per doz, 9d.

Watsonias. A magnificent and indeed stately class of plants well worthy every attention. They should be treated similarly to Gladioli, and will be greatly appreciated.

Choicest mixed, por 100, 10s. 6d.; per doz. 1s. 6d.

Zephyranthes candida (The Pernyian Swamp Lily). Flowers white, very pretty for pots in the cool greenhouse in Autuum.

Hybrid Perpetual Roses.

This magnificent and beautiful class of Roses is better than any other adapted for exhibition and pot culture. They continue in flower from the early part of June to the end of October, and are by far the most desirable for general cultivation. Our stock of these, grown at our Nurseries, comprises many thousands of the newest and choicest varieties in standards and dwarfs, and the past season having been very favourable to their growth, the plants we offer will be found unusually well grown and vigorous, and may be expected to produce a fine display of bloom next season. Our standards and half-standards are all worked on the Dog Brier, dwarfs on Manetti stocks.

HINTS ON CULTIVATION.

Situation.—In planting Roses select, if possible, an open situation, where they get the full benefit of sun and air, and at the same time are sheltered from strong winds. If really fine Roses are desired they should be planted a fair distance apart and have the ground all to themselves. An abundance of beautiful Roses may, however, be grown by planting in almost any convenient place

in the flower garden where not too much shaded, if moderate attention is given to pruning, insects, &c.

in the flower garden where not too much shaded, it moderate attention is given to pruning, insects, ac.

Soil and Planting.—Generally speaking, Roses will thrive in any good garden soil, but as they have a decided preference for that which inclines to the clayey or loamy, it is advisable in planting, where the soil is not of a suitable nature, to work in a good portion of well-decayed manure, and good rough fibrous loam; where the soil is heavy, a moderate dressing of coal ashes will improve it, and if too wet drainage must be provided. November is the best month for planting, but this may be done in any favourable weather during the Winter months. In planting, open a good-sized hole and fill with freshly prepared and suitable soil, taking care to plant firmly; dwarfs should be planted with the juncture of their stems below the surface, and standards should be firmly staked and tied to prevent their disturbance by the wind firmly staked and tied to prevent their disturbance by the wind.

Fruning.—To ensure a vigorous growth and fine blooms, freshly planted, and indeed all hybrid perpetual and other ontdoor Roses, should be closely pruned about the early part of March, or later according to season. When the leaf-bids begin to expand carefully thin out all weak-growing shoots or wood from the middle of the plant, and prune down the main stems to two or three eyes or bids on each stem. An occasional slight pruning and thinning-out during the Summer, when the first lot of bloom is going off, will greatly prolong the time of flowering and improve the quality of the late blooms.

Manuring and Watering.—Roses are gross feeders and will absorb almost any quantity of manure. A good top-dressing of well-deeayed manure should be laid on the beds in Autumn, and may be lightly dug in in Spring, or, if appearances are not of much consequence, a rich mulching of short manure may be placed about the roots in Spring, and will stimulate the plants into splendid growth and flower. If the weather is dry when the plants are coming into bloom, they should have liberal waterings two or three times a week, and if fine blooms are desired for exhibition the buds should be thinned out, and liquid manure may be given freely once or twice a week, this, with frequent stirrings of the surface of the beds will keep the plants in good growth and vigour.

freely once or twice a week, this, with frequent stirrings of the surface of the beds will keep the plants in good growth and vigour.

Insects.—Early in the season, when growth has fairly commenced, caterpillars should be carefully looked after and picked off by hand, and if the plants later on are attacked by green-fly, they should be syringed at night, or early morning, with tobacco-water, fir-tree oil, or some other cleanser. One of the best remedies for green fly is a solution of quassia chips and soft soap. Boil four ounces of the chips fifteen minutes in a gallon of soft water, then strain, and whilst cooling add four ounces of soft soap, which will readily dissolve, add to this, when cool, another two gallons of soft water, when it will be strong enough to apply with a brush or syringe, and is very effective.

Hybrid Perpetual Roses in Collections.

fine variety, and customers ordering may depend on their giving the most unqualified satisfaction. cases good healthy plants will be sent, and in the best variety of colour, &c., that can be included in the number given, but in all instances the selection must be left to ourselves.

CARRIAGE FREE. IMPORTANT NOTICE.

To meet the requirements of many of our numerous customers, we send all these collections Carriage Free to any part of the British Isles at prices quoted, and we make no charge for packing.

Roses—Tea-scented and Noisette.

This beantiful class is distinguished by the peculiar and delightful fragrance of the flowers, and the many charming tints and shades of yellow, reso and salmon colour not to be found amongst the hybrid perpetuals. The individual blooms are of exquisite form, and invaluable for button-holes or bouquets. They are especially suited for pot culture in the conservatory, and planted ontside on slightly raised beds in a sheltered position, and given a slight protection in Winter, they will furnish some beautiful flowers throughout the Summer and Autumn.

Our own selection, in choice variety, plants mostly established in pots, per doz. 15s., 18s., and 21s

New Hybrid Tea-scented Roses.

Climbing Roses, Hardy and others.

The following list of Climbing Roses includes the most useful and beautiful varieties in cultivation. For pillars, walls, or arches in exposed positions the fine old varieties of Ayrshire, Evergreen, Banksia, Boursault, Cheshuut Hybrid, Gloire de Dijon, and Aimee Vibert are the most desirable; whilst for greenhouse work the beautiful Marechal Niel, Climbing Nipbetos, and Climbing Devoniensis are the bost.

WILLIAM ALLEN RICHARDSON.

Aiman Wihart (Naisatta) Small rura milita	8.	đ.
Aimee Vibert (Noisette). Small pure white	1	0
flowers in large clusters; very hardy Ayrshire, Dundee Rambler. White, edged	•	•
pink	1	0
pink Queen of the Belgians. Pure white	ī	0
Banksia alba, or white. Pure white	1	6
Banksia alba, or white. Pure white , lutea, or yellow. Fine yellow	1	6
Boursault (Rosa alpina), Amadis, or crimson	1	0
Catherine Bell. Bright rosy pink	1	0
Cheshunt Hybrid. Bright cherry carmine,		
large open flowers; a very hardy and strong		
grower; fine	1	0
Climbing Devoniensis (T). Magnificent		
strong-growing variety, flowers creamy white with blush centre; deliciously scented		
with brush centre; delicionsly scented	7	6
1s. 6d., 2s. 6d., 3s. 6d., 5s., and Climbing Niphetos. A fine new, rapid growing,	-	O
elimbing tea-scented variety; shoots running		
to twenty feet in one season, flowering on lateral		
shoots from their main stems continuously;		
blooms of a purer white than those of the old		
variety, not showing the pink tinge, and oven		
more delicately scented. First Class Certificate

 Seedlings from the well-known Gloire de Dijon. 		

Moss Roses.

CRIMSON GLOBE (New Hybrid Moss). Buds nicely mossed, flowers deep crimson, large, full, and globular, growth very vigorous. This magnificent Rose will be a great acquisition to the Moss Roses, as it possesses the qualities of a show flower combined with the true moss characteristics. First Class Certificate, Royal Horticultural Society ... Dwarfs only, each 3s. 6d.

Blanche Moreau. Perpetual Moss, pure white flowers in clusters, well mossed ... Standards 2s.; Dwarfs 1s.

Common Moss. Rosy blush, mossed well up the bud Standards, each 2s. Dwarfs, per doz. 10s. 6d.; each 1s.

White Moss. Pure white, beautifully mossed Dwarfs only, per doz. 10s. 6d.; each 1s.

Miscellaneous Roses.

AUSTRIAN COPPER. Distinct and beautiful, golden terra-cotta colour, flowers single ... each 1s.

AUSTRIAN BRIER (PERSIAN YELLOW). Deep golden yellow, full, double flowers ... each 1s.

PROVENCE OR CABBAGE ROSES—
Old Provence. Rose colour, very fragrant ... each 9d.
White Provence. White, beautiful bind ... each 9d.

ROSA RUGOSA, Japanese Roses. Beautiful varieties, bearing very large single blooms, followed by handsome fruit in Autumn; highly ornamental.

Alba. Pure white, very large and sweet ... each 1s. 6d.

Rubra. Bright rose, very sweet scented ... each 1s. 6d.

CRIMSON CHINA. Dark crimson, dwarf and pretty; an old favourite ... each 1s.

A FEW HINTS ON FRUIT CULTURE.

Horticulturally speaking, we know of no more interesting, pleasant, or profitable occupation than that of cultivating a really good collection of choice Fruit Trees, and although the preparation of the soil and the planting may, in some instances, entail a rather heavy outlay, we have abundant evidence to show, that ground planted in the way suggested, and the trees fairly cultivated, will, after a few years, yield the most satisfactory results. The enormously large and increasing annual importations of Apples and other fruit from Americs, the Continent, and Tasmania, furnish a sure indication of the large and fast increasing demand for all kinds of choice fruit in this country, and although the importations referred to are in many instances of excellent quality, it must be admitted that good English-grown fruit is, yesr by year, becoming more and more appreciated, and it is clearly shown by the splendid samples being brought to our markets and sold at highly remunerative prices, that by planting only really choice varieties, and with good cultivation, Apples, Pears, and other fruits can be grown in this country of a size, flavour, and quality altogether surpassing those of foreign production.

This is especially the case in regard to Apples and Pears, choice samples of fruit of really good sorts always commanding a ready sale at high prices, whilst the supply every season falls very far short of the greater and greater demand. Intending growers should, however, be careful to note that it is only the best varieties that command the highest prices, and when planting should exercise the greatest care that only the best and choicest sorts are planted, as inferior kinds often do not pay for the trouble of gathering.

With a knowledge of the above facts, and keeping in mind our large and constantly increasing population, it is fairly certain that for some twenty or more years to come, at least, choice fruit growing in this country may be pushed on vigorously without any fear of the market being glutted; and we should certainly advise all landowners, who have not done so already, and all others having snitable ground with fair scenarity of tenure, to at once make a start in fruit growing, as we feel sure that if intelligently handled it will pay, and well.

Wherever space in the garden will admit, fruit of some kind should be grown, as, apart from its great usefulness in point of domestic economy, its great value as a health agent cannot be fairly over-estimated where it is freely used in the household. Plums, Gooseberries, and other small fruits are admirably suited for making into jams for winter consumption, or for wines and other drinks, and in which state they are very wholesome, but Apples are undoubtedly the most useful as an article of food; they contain more phosphorus than any other known fruit, are highly nutritious, and eaten freely when ripe and at their best, they almost entirely remove the desire or necessity for any kind of alcoholic or other beverage.

For small gardens such compact-growing fruits as dwarf or pyramid Apples and Pears, Gooseberries, Currants, Raspberries, and Strawberries are the most useful, and where there is a good south wall a Vine or Peach should be planted, whilst a wall with a westerly aspect will do well for Cherries or Pears, and a north wall is well suited for Currants. In planting in the garden be eareful to plant at such a distance apart that the plants get the full benefit of light and air, the result of over-crowding being but too often barrenness or inferior quality.

For Fruit Farmers and other growers for sale and gardens where the space is limited, dwarf or pyramid Apples and Pears are decidedly the most profitable to grow. They may be planted much closer than standards, and in many varieties may be cultivated into good bearing in three or four years, in fact, whilst standards planted at the same time will only have made a fair start into growth.

For large occupations, dwarf, bush, or pyramid Apples and Pears may be planted in rows six or eight feet apart, and the trees six or eight feet apart in the row, or they will do still better if planted in rows twelve to fifteen feet apart, and six or eight feet apart in the row, with lines growing between, of such fruits as Strawberries, Raspberries, Gooseberries and Currants or such vegetables and salads as Peas, Beans, Asparagns, Lettuce, Onions, Potutoes, Rhuburb, Endive, &c., and good ground filled in this way and well cultivated is amazingly productive. For smaller occupations the dwarfs or pyramids are best planted six or eight feet apart, in rows on each side the walks, and about three feet from the paths, leaving the space behind for the ordinary garden crops, whilst a line or two of Strawberries may be grown in front.

In selecting ground for fruit growing, a position should be chosen that is fairly open without being too much exposed to high winds, which at certain seasons are very injurious. Generally speaking, a good deep loamy soil is the most favourable, but with a fair amount of preparation, almost any soil will, in a good season, grow an abundance of excellent fruit. Heavy water-logged ground should be well drained before planting, and should have a good dressing of lime or ashes, whilst light sandy soil will be wonderfully improved by having a good addition of loam or well-pulverised clay worked in. In planting, care should always be taken to spread out the roots as naturally as possible, and where the land is heavy, they should be kept close to the surface; standards should have a good stont stake placed to each to secure them till firmly established.

When planting standard Apples, Pears, Plums, and Cherries on meadow land for forming an orchard, the trees should be planted not less than twenty feet apart, and for Apples only the distance should not be less than twenty-five or thirty feet apart. In planting, remove for each tree about six feet square of turf, and about eighteen inches of the top soil, trench or break up the bottom, working in a good portion of well-decayed manure. Chop up the turf removed and mix with the top soil removed, adding some well-decayed manure, till up the hole with this, plant the tree in the centre, make firm about the roots, stake and give a mulching of well-decayed manure.

In very dry weather young fruit-bearing trees of Apples, Peurs, Plums, &c., are much benefited by a liberal supply of water, which promotes a healthy growth and prevents cracking of the fruit; whilst sewage water, house slops, thrown on the ground about the roots in Winter and Spring, will add much to their productiveness. When fruit trees are growing vigorously, some attention should be given to the stopping and thinning out of the branches, to prevent them becoming erowded, and in the case of pyramid or dwarf trees, they should be partially lifted every two or three years, and the roots slightly pruned. This is an important matter, and if properly carried out, and the trees are liberally treated with mulchings, manure waterings, &e., an abundance of fine fruit may almost always be relied on.

Miscellaneous Fruit Trees, &c.

Our Nursery Grounds are especially favourable for the cultivation of Fruit Trees, and to meet the constantly increasing demand amongst our customers, we annually rear many thousands of Apples, Pears, Plums, Cherries, Peaches, Apricots, &c. All are grown hardily, and the plants lift with abundance of fibrous root, a very essential requirement for their successful transplantation, after-growth, and fruitfulness. A glance at our list will show that we offer a very fine selection of the choicest varieties, and we respectfully invite all who have not yet favoured us with their orders for Fruit Trees to give us a trial, as we feel sure they will be highly pleased with the quality of the plants we send.

The prices quoted per dozen for Apples, Pears, Gooseberries, Currants, &c., are for our own selection of kinds, and are governed principally by the size and strength of the plants supplied.

New Apple—Vicar of Beighton

We have much pleasure in introducing this fine Apple to the herticultural public, who, we feel sure, will highly appreciate its many good qualities. A seedling raised in the Vicarage Gardens at Beighton, Norfolk, it has preved itself one of the handsomest, most prolifie, and best keeping apples in cultivation. The fruit is large and roundish, and when ripe of a deep bright erimson colour, mottled, and striped with yellow and green, giving it the most beautiful appearance, which, if well kept, it retains till April or May; whilst its pale yellow flesh is of fine flavour, juiey, and all that can be desired in a first-class kitchen Apple. Will prove a mest valuable sort for market grewers on account of its very handsome appearance and excellent keeping qualities.

Dwarf Bushes or Maidens, each 2s. 6d.; Pyramids, each 5s.

New Apple—Beauty of Bath.

This fine new early Dessert Apple, on account of its earliness, extremely handsome appearance, good flavour, and free cropping qualities, will eventually, both for market purposes and private use, take the leading place among first early Apples.

nse, take the leading place among first early Apples.

The "Beauty of Bath" is fit for use at the end of July and early part of August. It immediately follows the Juneating, and is earlier than the Irish Peach, from which it is quite distinct. The fruit is of medium size, round and flattened, the ground colonr a yellowish green, beautifully striped and spotted with crimson toward the sun; the flesh is firm and pale yellow, and it has a brisk, sub-acid flavour far superior to that of other early apples. It is a certain and free eropper. Our stock trees have not failed once during the last six years, and it will on this account be a valuable market variety.

Strong Maiden Trees, each 2s. 6d. and 3s. 6d.

SELECT APPLES.

OUR Apples are mostly worked on the ordinary or crab stock, we can, however, supply several of the best varieties in dwarfs on the paradise stock, and shall be happy to furnish a list of these if requested.

"The Most Productive Gooseberry in Cultivation."

"WHINHAM'S INDUSTRY" GOOSEBERRY.

This superb variety has fairly established its reputation as one of the finest and most profitable Gooseberries in existence. The fruit

are of enormous size, and when ripe, of a dark, dusky red colour; it is of fine quality, and cannot be surpassed for preserving. The plant is of robust growth, and, as shown in our illustration, is marvellously prolific. Upwards of three tons of splendid fruit have been gathered from half-an-aere, and as much as twenty-six tons of this fine Gooseberry have been grown on 3½ aeres.

"Whinham's Industry" Gooseberry attains a marketable size quite three weeks in advance of any other variety of Gooseberry at present in cultivation, and in consequence commands the highest prices obtainable in the market. It is undoubtedly the heaviest cropping variety in cultivation, and has never been known to fail in producing a splendid crop even in seasons when other varieties were a failure. It possesses a peculiar advantage over other kinds by coming into leaf some time before it flowers, consequently the foliage protects the bloom from destructive Spring frosts. Another property is that it succeeds better than any consequently the foliage protects the bloom from destructive Spring frosts. Another property is that it succeeds better than any other variety under the shade of trees.

Strong bushes, per 100, 40s.; per doz. 6s.; each 8d.

Fruit Trees Received in Winter during Frost.

The Trees closely packed as received, should be placed in a cellar, or some place where the frost cannot penetrate, and remain there till a thaw takes place, and then be unpacked and planted. With this treatment, even if they are frozen through when received, they will not sustain the least injury.

Prom COLONEL SANDERSON, Glenlaggan, Nov. 27th. "The Fruit Trees have arrived in safety, and we are much pleased with them and with the admirable manner in which they were packed."

From Mrs. WALKER, Thornhill, N.B.

Oct. 27th.

"Mrs. Walker has had a splendid crop of very large Apples from the Trees sent her last by Messrs. Daniels, when those of the neighbourhood have bad a very judifierent crop."

From Mr. GEORGE BAKER, Redan Hill, Aldershot. Oct. 27th.
"The Fruit Trees arrived quite safe, and I am very pleased with them; they are far beyond my expoctations, and I must say that, after dealing with your firm for sixteen years, I have never been disappointed with anything I have ordered from you."

From Mr. D. E. FANNER, Cheam, Surrey.

Oct. 2nd.
"All the Fruit Trees I received from you are doing well; the Raspberries have been a picture, with very large fruit on them all."

Strawberry Plants—Select List.

New Strawberry—Laxton's "Noble."

This is a very large and handsome, regularly formed, flattish, globular-shaped early Strawberry, coming in a few days after King of the Earlies and Black Prince, and of a rich and vinous flavour, flesh firm, and without the objectionable treaely taste common to many large varieties; colour bright erimson searlet. Plant very hardy and vigorous, and most prolific, nearly every small runner producing wonderful trusses of large even-sized fruits with comparatively few small; as Noble ripens in the open air before forced Strawberries are over, the highest prices have been realized for it in Covent Garden Market during the past four seasons. In 1885 the first consignments made 4s. per lb., in 1887, 3s. 6d. per lb. Awarded a First Class Certificate by the Royal Horticultural Society, July, 1886.

100 in 10 choice varieties, our own selection

Strawberries when well-grown are wonderfully prolific, and constitute one of the most profitable crops, really good fruit always meeting with a ready sale at high prices. These delicious and wholesome fruit should be grown freely in every garden where there is room for them. As will be seen, our collection of choice Strawberries, a select list of which we offer below, contains all the finest varieties in cultivation. The best system of culture is to plant in rows $2\frac{1}{2}$ feet apart and 18 inches apart in the row; keep free of runners and give a top dressing of well-decayed manure in Winter.

New Strawberry. "Latest of All" (LAXTON).

A GRAND new seedling from British Queen crossed with Helena Gloede. The write is very large, exceeding in size that of either parent, and is certainly the finest flavored and largest late Strawberry yet introduced. The flesh is firm and white, the flavour vinous, yet luscious and quite equal to that of British Queen, which it most nearly approaches in appearance, but ripening from ten days to a fortnight after it. It has, indeed, been gathered three weeks after other Strawberries are past. The plants are hardy, vigorous and prolifie, and will thrive on any soil where Strawberries can be fairly grown. Will prove a fine acquisition for market growers

Per 100, 20s.; per doz. 3s. 6d.

A. F. Barron (Laxton). A cross between Sir J. Paxton and Sir Charles Napier. Very fine. First Class Certificate, Royal Horticultural Society. Per 100, 7s. 6d.; per doz. 1s. 6d.
 Commander (Laxton). A cross between British Queen and President, and said to be evon superior in flavour to British Queen. One of the most distinct and splendid Strawberries yet raised ... per 100, 7s. 6d.; per doz. 1s. 6d.

Clematises.

These magnificent hardy climbers are highly popular amongst amateur growers, and considering their great beauty, freedom of blooming, and the facility with which they may be trained on any kind of wall, trellis, verandah, or pillar, and in almost any aspect, it is surprising that Clematises are not found in abundance in every garden. The plants we offer are established in pots, and can be removed at any time of the year. The sorts blooming after June are the best for bedding purposes; they flower on the young wood, and therefore require before growth commences in Spring, to be cut down to within six or twelve inches of the ground, as likewise do all the lateflowering kinds; and early sorts, flowering from May to July on the old wood, should be pruned similarly to Roses. When the selection of sorts is left to ourselves, customers may rely on our sending a really good variety. Months of

Hardy Evergreen Shrubs & Coniferous Plants.

WE have a fine collection of these in sturdy healthy young plants, all of which were transplanted during the past season, and are in splendid condition for removal.

Our own selection of sorts, \{ \cdots & \ldots &

RHODODENDRONS—Garden Hybrids.

The cultivation of these beautiful hardy evergreen flowering shrubs has been greatly on the increase since the discovery that peat soil is not absolutely necessary for their successful growth. Sandy peat free from stagnant moisture probably suits them best, but they will do well in sandy loam or even clayey loam, if free from calcareous matter, whilst we have seen many beautiful specimens growing in ordinary light garden soil. The colours of the flowers range from the richest and most intense crimson to the most delicate shades of rose and pure white, the masses of beautiful bloom having a charming appearance with the rich dark green foliage.

Choice named varieties. Our own selection, according to size each 2s. 6d., 3s. 6d., and 5s.; per doz. 24s., 30s., and 40s.

Standards and half-standards

each 7s. 6d. to 21s.

Unnamed Hybrids. Good kinds, producing a beautiful variety per doz. 12s., 18s., 24s., and 30s.

Rhubarb.

Strong plants of the following, each 9d.; per doz. 7s. 6d.

Myatt's Linnæus Scarlet Defiance

Royal Albert Myatt's Victoria

Paragon (Kershaw). The most wonderfully prolific kind known; as much as £240 has been made off a single acre for market purposes ... each 1s.; per doz. 10s. 6d.

Sea Kale.

Our forcing Sea Kale this season is remarkably fine.

Strong planting roots per 100, 7s. 6d. Good strong roots, for forcing

per doz. 1s. 6d.; per 100, 10s. 6d. Extra strong roots, for forcing per doz. 2s.; per 100, 15s.

GRAND FENCING PLANT. MYROBELLA CHERRY PLUM

(Prunus myrobalana).

This was introduced some few years ago by the late Mr. Ewing of the Eaton Nurseries, and has undoubtedly proved itself to be the very best Feneing Plant ever grown. For rapidity of growth it is unrivalled, and, under fair conditions, will make a capital fence in three or four years from planting. It also grows vigorously in the poorest soils, and is first-class for planting in exposed situations or by the sea coast. It is quite hardy and will stand the severest frosts without injury.

The Myrobella does not often fruit in this country save in the South or West of England and in sheltered positions in the

Eastern and Midland Counties, and then only when allowed to grow iuto trees or large bushes, it, however, forms a capital stock for Plums, and if strong single stems are allowed to grow from the fence at intervals of about twelve feet, they may be budded or grafted

Plums, and if strong single stems are allowed to grow from the fence at intervals of about twelve feet, they may be binded or grafted with choice varieties of this popular fruit, and in a few years will form a most profitable and ornamental hedgerow.

The best time for planting is in November or early Spring, or it may be done in open weather at any time during the Winter months, but in fairly moist weather successful plantings may be made as late as the middle or end of April. In planting plant firmly, placing the sets from six to nine inches apart according to size. After planting, about the time that growth commences, they should be cut down to eight or ten inches in height. It will bear almost any extent of clipping, and should be cut at least twice a year—about the end of July and in Winter or Spring whilst in a dormant state, and should be fairly triumed the first year or two after planting to ensure a good bottom for a strong and thick fence, but it may be clipped in to form a fence no thicker than an ordinary garden wall, which will be found quite impenetrable. As the plants advance in age the branches become armed with long, sharp spines, which make the fence impenetrable to cattle, &c. Myrobella will therefore be found splendid for making new or improving old fences, and much superior to Whitethorn or any other fencing plant.

UNSOLICITED TESTIMONIALS.

We have received the following communication respecting a large quantity of Myrobella, supplied to HIS GRACE THE DUKE OF PORTLAND'S Estate, at Bothal Castle:—

From THOMAS SAMPLE, Esq., Estate Office, Bothal Castle, Morpeth.

Oct. 8th, 1889.

"I am very much pleased with the Myrobella or Cherry Plum plants which you sent me last Spring and which have thriven well. I should like to have another 5000 good plants."

From THE "GARDENER'S MAGAZINE."

Aug. 29th, 1889.
"It is one of the best of plants for a close live fence, for it needs but the most simple management to ensure a free growth from the bottom, and this soon becomes so close and so formidable with spines as to be impenetrable by eattle, and equally so against human intruders."

From J. G. THOMPSON, Esq., Shelton Manor, Newark.

"The ${\bf Myrobella}$ you sent me are growing well, far surpassing the Thorn planted same time."

Other Plants for Fencing.

We annually raise many limidreds of thousands of the following useful fencing plants, and where large quantities are required shall at all times be pleased to furnish special quotations when requested. Our stocks of these are this season unusually fine, and will be found in the best possible condition for planting. WHITETHORN OR QUICK. CINERARIAS. Large-flowered

1s. 6d.

CARNATIONS & PICOTEES. From choicest-named flowers per doz. 1s. 6d.

PRIMULAS. Choicest mixed

-1s. Gd.

Hardy Perennial Flowering Plants.

We have a fine collection of these popular, interesting, and beautiful plants, which are daily coming more and more into favour with the Gardening Public. All the varieties are perennial, extremely hardy, and many of them produce flowers of the most exquisite beauty, which are very valuable for cutting, whilst the dwarfer growing sorts are admirably suited for rockeries, or edgings. No special soil or position is necessary, as with but very few exceptions, they will thrive almost anywhere, and with a moderate collection, a charming variety and succession of bloom may be had throughout the Spring and Summer. The plants we offer are all grown in pots, and may be removed at any timo or season.

CHRYSANTHEMUM MAXIMUM

Adonis vernalis. This is a beautiful, early, Spring-blooming plant, with clear golden yellow flowers, known as the "God of Lovo." The individual blooms are very large comparative to the size of the many-times divided foliage, its general height being six inches. It will thrive in any kind of soil and most situations, and is perfectly hardy per doz. 4s. 6d.; each 6d.

Anemone-Japonica alba. One of the very best Autumnblooming plants we have. Blooms produced in great profusion, and of a beautiful pure white

per doz. 5s.; each 6d. rosea. Similar to preceding, but flowers ul rose colour per doz. 7s. 6d.; each 9d. of a beautiful roso colour

Violets—Sweet-scented.

These deliciously-scented and ever welcome favourites, so extremely useful as cut flowers for bouquets, button-holes, &c., may, with a little management, be had in abundant bloom throughout the Winter and Spring months—a time when they are especially valuable. The stock plants should be divided in April or early in May and planted out in rich soil in a partially shaded position, valuable. The stock plants should be divided in April or early in May and planted out in rich soil in a partially shaded position, the doubles in rows one foot apart and nine inches apart in the rows, the singles one foot apart each way. As growth commences, the young shoots or runners should be removed and the plants should be watered in the evening in dry weather, whilst if extra fine plants are required, they should have a mulching of well-decayed manure from an old mushroom bed or cucumber frame. Towards the cud of September the plants may be lifted and planted into specially prepared frames placed in a south aspect, and partially filled with stable litter, leaves, &c., with about six or eight inches of soil on the top. The plants should be placed sufficiently close together to fairly fill the space without crowding, and should be as near the glass as the foliage will admit. When planted, give a thorough watering and keep close for a few days, after which admit air freely at every opportunity through the Winter. The glass may be entirely removed in sunny weather when there is no frost, and in all mild weather plenty of wentilation should be given. Marie Louise, Count Brazza's, and Neapolitan are the best of the doubles to be grown in this way, and when treated as recommended above will produce some grand flowers. when treated as recommended above will produce some grand flowers.

Double-flowered vars. Count Brazza's Neapolitan White (syn. Swanley White). Magnificent variety; large, double, pure white flowers, delicionsly scented; the finest of all double white Violets; splendid for bouquets. HINTS TO AMATEURS

IN MAKING A NEW LAWN OR TENNIS GROUND.

In constructing a new Lawn or Tennis Court, the ground should be carefully prepared. An open level piece of ground, naturally well-drained, should, if possible, be selected; but where a good natural position is not to be obtained, the soil must be removed from the higher to the lower parts until the surface is perfectly level; and if the ground be too moist or retentive, it should be thoroughly well drained. Let the ground selected be well dug to the depth of eighteen inches or two feet, and an equal depth of soil obtained. If poor, a good coating of well-decayed manure should be incorporated with the soil. After digging, rake down level, and roll or beat the surface to an equal frumess all over. A frequent mistake is made in carting the soil on to the plot to be laid down instead of having it wheeled on planks laid down for the purpose. The cart-rut so made is much harder than the surrounding ground, and when the natural subsidence takes place a very uneven surface is left. The surface soil to the depth of three inches should also be as nearly as possible of equal richness, in order that the grass should grow evenly and of the same colour. April and September are the best months for sowing, and the quantity of seed from half a pound to one pound to the rod, or from three to six bushels to the acre. best months for sowing, and the quantity of seed from half a pound to one pound to the rod, or from three to six bushels to the acre. All weeds should be removed as soon as they make their appearance, and when the grass has grown to the height of three or four inches it should be cut and rolled. Frequent cutting and rolling are of great importance where a fine, close, and soft turf is required, and an occasional dressing of Daniels' Eureka Manure will also be found of great service in promoting a healthy growth of the young sward. The renovating and improving of old lawns is also a work of importance at the proper season—say, in April. Daisies and other weeds should be eradicated. The holes that these weeds are taken from should be filled up with soil, which should be beaten hard into them; and the surface of the lawn ought then to be sown over moderately thick with Finest Lawn Mixture, and covered with another heavier sowing of sifted soil, the whole being rolled down. This rolling should be done when no fear exists of the soil adhering to the roll. It is surprising what good can be effected (to say nothing of the pleasure derived from the improved appearance) from a small outlay annually, by employing cheap labour for a short time each year, and by giving an annual surface-dressing. Grass seeds can never be fairly sown too thickly for making a new or improving an old lawn, as it is found that the thicker the seed is sown, the finer will be the turf. As many varieties of small birds are very fond of grass seeds, it will be well, when sown, to give some protection for a short time till the plants are up.

Daniels' Mixtures of Lawn Grass Seeds

FOR TENNIS LAWNS, CROQUET AND CRICKET GROUNDS, &c.

Carriage Free in quantities of not less than 2 lbs.

... per lb. 1s. 0d. per bush. 20s. Mixture of Dwarf Grasses, for producing a fine close turf Fine Mixture of Dwarf Grasses, for producing a dark green velvety turf 1s. 6d. 25s. Finest Mixture of Dwarf Evergreon Grasses, extra choice 2s. 0d. 30s.

From Mrs. BURKE, Springmount House, Rathfarnham.

Jan. 25th. Lawn Grass Seed you sent me is wonderful. We shall be able to play tennis upon the grass this summer to the astonishment of oar neighbours.

From G. STEWART HARDY, Esq., Jersey.

Oct, 7th.
"I may tell you the Grass Seed you sent me last year has been most successful, and given the best of turf."

From Miss HARRISON, Dover

July 30th, "Miss Harrison begs to inform Messrs Damels that the Lawn Grass Seed sent last Spring has succeeded perfectly under most unfavorable conditions, and excited the admiration of the gardeners that sowed it."

From Mr. G. WORKMAN, Berkeley.

Oct. 18th.
"The Lawn Grass Seed supplied by you for my new tennis lawn bas grown beautifully."

Mushroom Spawn.

THE importance of Mnshrooms as a remunerative crop has of late been receiving considerable attention, and the facility of their culture, both out of doors, in sheds, and houses specially arranged for their growth, has led great numbers of new growers, large and small, to successfully attempt the pro-

duction of this esteemed and highly nutritious esculent.

Possessors of Mushroom Houses proper, it may be safely assumed, experience no difficulty in raising successional crops, and maintaining a continuous supply; but to such of our customers as may have only the convenience of a shed, cellar, or sufficient space for a bed or beds ont of doors, a few hints on cultivation which we here give, will, if carefully and intelligently followed, lead to almost certain success. The first important point is the acquisition of good Spawn: this want we shall at all times be happy to meet.

Scarcely second in importance is the use of perfectly suitable material, for although inferior and badly manipulated mannre may produce a crop, such crop will be poor in quality and of brief duration. Obtain stable mannre which has been made as much at the same time as possible, avoid having both old and freshly made mixed together, and let the preference be given to such as can be procured from stables where horses are fed on dry food. The quantity required will of course be governed by the form and size of the heds which it is intended to make. Now place the manure as it is received from the stables in a firmly hull theap, but not pressed too hard, and while doing so do not attempt to separate all the straw from the droppings, but remove only the longer and cleaner straw, and the heap will then be composed of half straw and half droppings or thereabouts and half droppings, or thereabouts.

If the heap be ont of doors let it be covered over, to prevent it becoming unduly wetted by rain, but at the same time the covering must stand clear of the mannre. In about six days time the heap will be in a thorough state of fermentation and consequent high temperature; now very carefully turn it over with a fork, taking care that and thorough state of fermentation and consequent high temperature; now very carefully turn it over with a fork, taking care that every part of the material is perfectly worked together, and the outsides of the heap be placed in the middle. Do this from four to six times on alternate days, according to state of material, which should be neither excessively wet nor dry, and in a fair state of fermentation, as either of these extremes is injurious if not fatal to the crop. The usual size for a bed is from two to three feet wide at the base and the same in height, being narrower towards the top. In making the bed the material should be well shaken out and firmly pressed down; if it is found that the bed is too hot a few ventilation holes will be necessary. When the temperature is about seventy or eighty degrees the Spawn may be inserted. Break each cake into about eight equal pieces: these should be firmly pressed into the bed about eight inches apart each way, with the smooth side outwards, so as to be about level with the surface. This may be done by raising the mannre with one hand and inserting the Spawn with the other, now make the surface of the bed even and press all down firmly. In about a fortnight's time the hed must be covered by about one-and-a-half to two inches, not more, of fresh all down firmly. In ahout a fortnight's time the bed must be covered by about one-and-a-half to two inches, not more, of fresh mould, and in the selection of this mould the satisfactory result of the crop in a great measure depends. In selecting this keep in mind that rich fallow loam is the most suitable, and the nearer to this that can be procured the better the result will be. From five to six weeks from the date of spawning the Musliroons (under favourable circumstances and if the work has been well done) may be expected to appear. Where the bed is under cover nothing more will require to be done, except occasional waterings when the hed becomes dry; but when in the open and exposed to change of weather, it must be covered with long litter or straw to keep an uniform temperature all around the bed.

DANIELS' BEST MILLTRACK.

Mushrooms can be obtained all the year round by using DANIELS' SUPERIOR SPAWN, manufactured expressly for their trade. Cultural directions sent with each order.

In Bricks, each 6d., 4 bricks 1s. 6d., 16 bricks or one bushel 5s.

FRENCH MUSHROOM SPAWN.

In Boxes, 2 lbs. 2s. 9d., 3 lbs. 4s., 4 lbs. 5s. 4d., 6 lbs. 8s. (if ordered to be sent per parcel post 3d. per lb. extra). These Boxes are the sizes generally required by Mushroom growers, and can be sent out just as received, thus preserving the Spawn from breaking.

This Spawn is of very fine quality, and is in a more concentrated form than the English make.

EVIDENCE OF QUALITY.

From Mr. F. DRAKE, Gardener to John Boyce, Esq., Catton.

"The produce of your Mushroom Spawn is truly marvellous, and a beautiful flavour. My two beds are literally covered with full-sized Mushrooms, and hundreds are shewing up small."

From Mr. R. T. COWING, Plumstead.

April 4th,
"I cannot speak too highly of the crop of **Mushrooms** I had last
year from the Spawn supplied by you. They exceeded any I ever had
before, both in size and quantity."

From Mr. JAMES LINGWOOD, The Gardens, Knapton House, North Walsham.

"I have great pleasure in testifying to the first-rate quality of your Mushroom Spawn. I gathered Mushrooms every morning for weeks, some of them measuring six inches across."

From Mr. J. FIELD, Gardener to R. Green, Esq., Maidenhead. Nov. 8th.
"The Mushroom Spawn was very good. I have a bed now worth photographing. I cut some off the last led over seven inches across."

Daniels' New Insecticide, Nicoto Paraffin Soap.

The safest and most effective Insecticide ever introduced. In Bars 6d. each; post free, 9d., or can be enclosed with general order carriage free.

EVIDENCE OF QUALITY.

From Mr. A. ROCHE, Gardener to the Right Hon. Lord Stafford, Cossey Park.

"I have given your Nicoto Paraffin Soap a long and fair trial. I consider it one of the best of the numerous Insecticides now offered to the public, and when better known it will be, to my mma, the most extensively used; so easily mixed, effectual and at the same time so very cheap. I tried the Insecticide with the greatest effect on Mealy Bug, Thrip, Brown and White Scale, Ants, Red Spider, Green Fly, &c. The young fronds of Maideu Mair Fern were not even injured by the trial."

per oz. -s. d.

Vegetable Seeds for Autumn Sowing.

DANIELS' NEW PEA-GEM OF THE SEASON.

DANIELS' DEFIANCE CABBAGE,

GIANT ROCCA ONION

Peas.

DANIELS' NEW PEA-GEM OF THE SEASON.

The earliest Pea in cultivation, height three feet, and very prolific. This early Pea is the most valuable for general use ever sent out; is always the earliest, whether sown in Autumn, Winter, or Spring; is also the hardiest, resisting frost better than any other kind; and is not affected by mildew. Being very prolific, and of a most delicious flavour, will be found most desirable for marketing, and invaluable for the private garden.

Price 2s. per quart.

By our careful and perfect system of packing, the Wreaths, Bouquets, &c., we supply, will stand a journey of fully two days if necessary, and then reach their destination in beautifully fresh condition.

All orders are despatched promptly on receipt, if required, but customers residing at a distance should give, if possible, at least two days' clear notice before the flowers are required.

TESTIMONIALS.

From Mr. GOLDING, Tredegar.

"The \mathbf{Wreath} arrived on Saturday morning and in good condition; it was highly satisfactory."

From Miss HARVEY, 20 Esplanade, South Lowestoft.
September 3rd.
"Miss Harvey begs to inform Messes. Daniels she is quite satisfied with the Cross, in fact it is simply perfect, and it arrived most heautifully fresh. Mr. R. H. Reeve is also very pleased with the Wreath sent him."

From Mrs. PENISTON, Doncaster.

"Mrs, Peniston hegs to thank Messrs. Daniels Brothers for their attention. The Wreath arrived safely. It was very beautiful, and gave great satisfaction."

- From W. S. LONG, Esq., Windsor.

April 7th. "The Bride's and Bridesmaids' Bouquets were duly delivered at Saxlingham, and gave the highest satisfaction. Enclosed is cheque in payment."

Daniels' Compound Tobacco Paper.

AFTER repeated trials at our Nursories, and by some of the most eminent horticulturists, we have much pleasure in recommending this Tobacco Paper as the very best ever offered for fumigating purposes. This quality has been specially propared for our retail trade, and will be found cheap, perfectly safe, and thoroughly effective. It is self-consuming, and will consequently be found of little trouble to use, and if kept in a cool, dry place, will retain its strength and soundness for years.

Every packet is accompanied with full instructions for use.

Price in 2-lb. packets, 3s. Daniels' Strong Tobacco Paper, for ordinary use, 1s. per lb.

NEW PLANT FOOD AND FERTILIZER.

EUREKA MANURE. DANIELS'

A highly concentrated Plant Food adapted for every kind of Flowor, Frnit, or Vegetable.

EFFICIENT, ODOURLESS, ECONOMICAL.

Will greatly improve the size and quality of all kinds of Flowers, Plants, Fruits, and Vegetables,

REPORT OF MR. FRANCIS SUTTON, F.C.S., F.I.C.

"Norrola County Laboratory."
"I have acquainted myself by experiment and analysis with the entire nature of your Eureka Manure, and may say at once you have carried out practically the ideas which I myself would advocate, viz., a manure safe, odourless, and adapted for the healthy growth and development of every variety of plants." From Mr. WILLIAM EARLY, Ilford, "Your Eureka Manure proved an excellent aid to pot plants."

From Mr. JOHN McDONALD, Quidenham Hall, "Unsurpassed for Fruit culture and soft-wooded plants," From Mr. F. CRESSWELL, Stoke Park, Ipswich.
"It is first-rate for Potato cultivation."

Sold in Packages, with complete Directions for Uso, Postal Boxes, \(\frac{3}{4}\)-lb. 1s., \(2\frac{1}{2}\)-lb. 2s. 3d, 6-lb 4s. 6d., Post or Carriage Free, at prices quoted. In Boxes, not Carriage Free, but can be enclosed in general order, without extra expense of carriage, 1-lb. 1s., 2-lb. 1s. 8d., 4-lb. 3s., 7-lb. 4s. 6d., 14-lb-7s., 28-lb. 12s. 6d. Much cheaper by the cwt.

This preparation is purely and simply a Manure in a highly concentrated form, without any admixture of other ingredients to make up bulk, and will be found more Cleanly, because it is entirely without smell, more Efficacious, because it is easily assimilated by all kinds of vegetable growths, and more Economical, because it is cheaper in comparison with other Manures, where quantity is preferred to quality.

MANURES AND FERTILIZERS.

Clay's Fertilizer. A most convenient manure for Amateurs, sold in packets 1s. each; in bags, 7-lb. 2s. 6d., 14-lb. 4s. 6d., 28-lb. 7s. 6d., 56-lb. 12s. 6d., and 1 cwt. 20s.

Florvita (The Life of Flowers). Contains all the elements essential to the healthy growth of a plant; bottles, 1s. and 2s. 6d. each.

Cocoa-nut Fibre. 6d. per bushel; 2s. per sack.

Daisicide. For destroying Paisics, Plantains, Dandelions, and other coarse plants, in Lawns and Grass Plots, and at the same time vastly improving the growth and quality of the grass. Price 20s. per cwt. in 1 and 2 cwt. bags, 56-lb. 10s. 6d., 28-lb. 6s., 14-lb. 3s. 6d., 7-lb. 2s., 3-lb. 1s. These prices do not include Carriage.
